

FINAL

Drainage and Stormwater Management Report – West Section Conservation Halton Area

Highway 413 Preliminary Design and
Assessment of Environmental Impacts

March 2026

WSP Statement of Qualifications and Limitations

WSP prepared this report solely for the use of the intended recipient, Ontario Ministry of Transportation, in accordance with the professional services agreement between the parties. The report is intended to be used in its entirety. No excerpts may be taken to be representative of the findings in the assessment.

The conclusions presented in this report are based on work performed by trained, professional and technical staff, in accordance with their reasonable interpretation of current and accepted engineering and scientific practices at the time the work was performed.

The content and opinions contained in the present report are based on the observations and/or information available to WSP at the time of preparation, using investigation techniques and engineering analysis methods consistent with those ordinarily exercised by WSP and other engineering/scientific practitioners working under similar conditions, and subject to the same time, financial and physical constraints applicable to this project.

WSP disclaims any obligation to update this report if, after the date of this report, any conditions appear to differ significantly from those presented in this report; however, WSP reserves the right to amend or supplement this report based on additional information, documentation or evidence.

WSP makes no other representations whatsoever concerning the legal significance of its findings.

The intended recipient is solely responsible for the disclosure of any information contained in this report. If a third party makes use of, relies on, or makes decisions in accordance with this report, said third party is solely responsible for such use, reliance or decisions. WSP does not accept responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken by said third party based on this report.

WSP has provided services to the intended recipient in accordance with the professional services agreement between the parties and in a manner consistent with that degree of care, skill and diligence normally provided by members of the same profession performing the same or comparable services in respect of projects of a similar nature in similar circumstances. It is understood and agreed by WSP and the recipient of this report that WSP provides no warranty, express or implied, of any kind. Without limiting the generality of the foregoing, it is agreed and understood by WSP and the recipient of this report that WSP makes no representation or warranty whatsoever as to the sufficiency of its scope of work for the purpose sought by the recipient of this report.

In preparing this report, WSP has relied in good faith on information provided by others, as noted in the report. WSP has reasonably assumed that the information provided is correct and WSP is not responsible for the accuracy or completeness of such information.

Benchmark and elevations used in this report are primarily to establish relative elevation differences between the specific testing and/or sampling locations and should not be used for other purposes, such as grading, excavating, construction, planning, development, etc.

Design recommendations given in this report are applicable only to the project and areas as described in the text and then only if constructed in accordance with the details stated in this report. The comments made in this report on potential construction issues and possible methods are intended only for the guidance of the designer. The number of testing and/or sampling locations may not be sufficient to determine all the factors that may affect construction methods and costs. We accept no responsibility for any decisions made or actions taken as a result of this report unless we are specifically advised of and participate in such action, in which case our responsibility will be as agreed to at that time.]

This limitations statement is considered an integral part of this report.

AECOM Statement of Qualifications and Limitations

The attached Report (the “Report”) has been prepared by AECOM Canada ULC (“AECOM”) for the benefit of the Client (“Client”) in accordance with the agreement between AECOM and Client, including the scope of work detailed therein (the “Agreement”).

The information, data, recommendations and conclusions contained in the Report (collectively, the “Information”):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the Report (the “Limitations”);
- represents AECOM’s professional judgement in light of the Limitations and industry standards for the preparation of similar reports;
- may be based on information provided to AECOM which has not been independently verified;
- has not been updated since the date of issuance of the Report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued;
- must be read as a whole and sections thereof should not be read out of such context;
- was prepared for the specific purposes described in the Report and the Agreement; and
- in the case of subsurface, environmental or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.

AECOM shall be entitled to rely upon the accuracy and completeness of information that was provided to it and has no obligation to update such information. AECOM accepts no responsibility for any events or circumstances that may have occurred since the date on which the Report was prepared and, in the case of subsurface, environmental or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

AECOM agrees that the Report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the Report and the Agreement, but AECOM makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

Without in any way limiting the generality of the foregoing, any estimates or opinions regarding probable construction costs or construction schedule provided by AECOM represent AECOM’s professional judgement in light of its experience and the knowledge and information available to it at the time of preparation. Since AECOM has no control over market or economic conditions, prices for construction labour, equipment or materials or bidding procedures, AECOM, its directors, officers and employees are not able to, nor do they, make any representations, warranties or guarantees whatsoever, whether express or implied, with respect to such estimates or opinions, or their variance from actual construction costs or schedules, and accept no responsibility for any loss or damage arising therefrom or in any way related thereto. Persons relying on such estimates or opinions do so at their own risk.

Except (1) as agreed to in writing by AECOM and Client; (2) as required by-law; or (3) to the extent used by governmental reviewing agencies for the purpose of obtaining permits or approvals, the Report and the Information may be used and relied upon only by Client.

AECOM accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the Report or the Information for any injury, loss or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the Report or any of the Information (“improper use of the Report”), except to the extent those parties have obtained the prior written consent of AECOM to use and rely upon the Report and the Information. Any injury, loss or damages arising from improper use of the Report shall be borne by the party making such use.

This Statement of Qualifications and Limitations is attached to and forms part of the Report and any use of the Report is subject to the terms hereof.

Executive Summary

The Ontario Ministry of Transportation has retained WSP Canada Inc. and AECOM Canada ULC in collaboration with various sub-consultants and technical firms to undertake the Highway 413 Preliminary Design and Assessment of Environmental Impacts, hereinafter referred to as “the Project”.

The Project is following the requirements of the *Highway 413 Act, 2024*.

The proposed highway crosses three different conservation authority jurisdictions; the Toronto and Region Conservation Authority (TRCA), the Credit Valley Conservation (CVC) and Conservation Halton (CH). Separate drainage and stormwater management reports have been prepared for the proposed highway segments in each jurisdiction and this report represents the highway segment in the CH area.

Within the CH jurisdiction, Highway 413 and the associated Highway 401 / 407 interchange is located within the Sixteen Mile Creek watershed. This 1.3 km long portion of highway mainly consists of the Highway 413 interchange with Highway 401 and Highway 407.

The proposed Highway 413 and associated interchange crosses several watercourses and drainage paths. Within the CH study limit, there are 18 existing culverts that convey flows across the transportation corridor. The proposed works will impact 14 culverts which will require either extension or relocation / modification. In addition, 12 new culverts will be required to convey flows across the proposed transportation corridor. Under existing conditions, there are 6 stormwater management ponds in the Highway 401 / 407 interchange area that provide water quality and quantity controls. The proposed works will impact three existing stormwater management ponds that will require relocation or modification.

Hydrologic and hydraulic assessment was completed for all existing and proposed watercourse crossings. The proposed culverts were sized to meet the required hydraulic criteria set forth by MTO and CH. Other disciplines were also involved in the design process and so structural, environmental, and fluvial geomorphology criteria were also considered in sizing the crossings.

The proposed highway and associated works will add approximately 31 ha of impervious area which will potentially impact the peak flow rates, runoff volumes and

stormwater quality. To mitigate these impacts, the following stormwater management measures are recommended:

- Maintain existing Pond 2, Pond 4 and Pond 5
- Relocate Pond 1
- Relocate and increase Pond 6 capacities
- Modify and increase Pond 3 capacity
- Provide three new wet ponds (Pond 7, 8 and 9)

Catchment areas were delineated to each of the pond locations, and existing and proposed drainage areas were modelled in Visual Otthymo hydrologic model to determine the amount of storage volume required to attenuate peak flows to pre-development levels. Permanent pool and extended detention volumes were determined using the Ministry of Environment, Conservation and Parks' (MECP) Stormwater Management Planning and Design Manual (MOE, 2003), with proposed pond grading assumed to determine the approximate footprint of each pond. These ponds were placed/relocated in locations adjacent to the receiving watercourses. Ponds were designed for an ultimate design scenario where the entire highway area is paved with no grassed swale in the middle. The impervious area of the proposed transitway was also included in the pond designs.

The following report will describe the various criteria to be met, the agencies involved, hydrology and hydraulic assumptions made and the resulting ponds, and culverts within the CH area.

1. Introduction

1.1 Project Overview

The Ontario Ministry of Transportation has retained WSP Canada Inc. and AECOM Canada ULC in collaboration with various sub-consultants and technical firms to undertake the Highway 413 Preliminary Design and Assessment of Environmental Impacts, hereinafter referred to as “the Project”.

The Project is following the requirements of the *Highway 413 Act, 2024*.

The Project includes the 52-kilometre Highway 413 Corridor, a 4 kilometre extension to Highway 410, and a 3 kilometre extension to Highway 427 (both facilitating connections to the Highway 413 Corridor), for a total of 59 kilometres of new infrastructure (Figure 1-1). The highway will have 11 interchanges at municipal roads. Features such as stormwater management ponds, carpool lots, Commercial Vehicle Inspection Facilities, maintenance facilities and the potential for electric vehicle charging stations have been explored as part of Preliminary Design.

Highway 413 will connect Highway 401 and Highway 407 Express Toll Route in the Regional Municipality of Halton and the Regional Municipality of Peel with Highway 400 in the Regional Municipality of York.

The typical right-of-way will be 170 metres which includes 110 metres for the typical mainline highway and 60 metres for a proposed transitway. A multi-use trail parallel to Highway 413 may be accommodated within the proposed transitway right-of-way. The right-of-way is expanded at interchanges and high fill areas to accommodate ramps to and from the crossing roads, as well as in locations with ancillary highway facilities as mentioned above. The Preliminary Design consists of a typical six-lane cross section (three lanes in each direction) with a grassed median. The right-of-way has been designed to accommodate up to ten-lanes (five lanes in each direction) should future traffic conditions warrant additional capacity. These additional lanes would be provided by widening the highway towards the median.

The proposed transitway will be a separate corridor running alongside the highway, dedicated for public transit, including stations to facilitate passenger access at key locations. The proposed transitway and stations will be subject to a separate future assessment of environmental impacts.

Highway 413 is a 400-series highway, which is a network of controlled-access highways throughout the Province of Ontario. Their primary function is to accommodate through traffic and provide links between urban centres. 400-series highways feature full grade separations (such as bridges) at most intersecting roads and railway lines. Interchanges are provided along the 400-series highways to connect to other highways and municipal roads. These highways have design standards to accommodate high speeds and various collision avoidance and traffic management systems. Highway 413 is proposed to have a posted speed limit of 110 kilometres per hour.

Figure 1-1: Highway 413 Route

The future Highway 413 is expected to:

- Relieve traffic on local roads and parallel highways,
- Help accommodate travel demand,
- Reduce travel times for commuters and goods movement,
- Reduce the social, environmental, and economic costs of congestion,
- Provide greater connectivity between urban growth centres,
- Provide better connections to residential and employment lands, and
- Provide an alternate route in the event of an incident or road closure on local and regional roads.

The overall objective of the drainage and stormwater management (SWM) plan is to minimize impacts on existing drainage systems within the study area and on the natural environment due to the proposed highway works in terms of water quantity and quality. For drainage and stormwater management assessment, the project is divided into three sections based on the proposed alignment located in the relevant jurisdiction of each Conservation Authority: Toronto and Region Conservation Authority (TRCA), Credit Valley Conservation Authority (CVC) and Conservation Halton (CH) Section as shown on **Figure 1.1** and described below:

- TRCA Section – an approximately 36.7 km long segment from north of Mayfield Road to Highway 400
- CVC Section – an approximately 12.4 km long segment from west of Tenth Line to north of Mayfield Road
- CH Section – an approximately 1.3 km long segment from west of Tenth Line to Steeles Avenue as well as the Highway 413, Highway 401 and Highway 407 freeway / freeway interchanges and their associated ramps bounded by Trafalgar Road (at Highway 401) to the west, Tenth Line West (at Highway 407) to the east, Steeles Avenue (at Highway 413) to the north and 0.5 km north of Derry Road (at Highway 407) to the south.

A separate drainage and stormwater management report is provided for each section.

This report documents the drainage and stormwater assessment for the proposed improvements at the west limit of the project including the Highway 401, Highway 407 Highway 413 Interchange located within the West Section of the project under the CH jurisdiction as shown on **Figure 1.2**.

Figure 1-2: Project Location

1.2 Background Review

The overall study area is within the jurisdiction of Toronto Region Conservation Authority (TRCA), Credit Valley Conservation Authority (CVC) and Conservation Halton (CH). This report will cover the portion of the study area within the CH jurisdiction.

The CH regulated area is within the West Section of the project study area as shown on **Figure 1.2**. It extends from 0.7 km west of Tenth line to the Highway 401 / Highway 407 Interchange to Trafalgar Road (at Highway 401) to the west, Steeles Avenue (at Highway 413) to the north and 0.5 km north of Derry Road (at Highway 407) to the south.

The foundation for the drainage and stormwater management design is based on a review of the existing documentation, including:

1. 1:10 000 Ontario Base Mapping
2. Topographic information and base maps as provided by MTO
3. MTO contract drawings
4. GTA West Corridor – Stage 1 study material
5. MTO contract documentation
6. Development reports, and hydrologic reports within the study area.

This above information was used to determine existing drainage conditions and to prepare a drainage mosaic for the study area.

1.3 Regulatory Agencies Consultation

The following regulatory agencies were consulted throughout this study to address their concerns and requirements for the proposed alignment.

- TRCA – Two meetings were held with TRCA October 6, 2020, and March 4, 2021, minutes of the meetings are included in Appendix A.
- CVC – Two meeting were held with CVC December 10, 2020, and December 12, 2022, minutes of the meetings are included in Appendix A
- CH – Two meetings were held with CH on September 30, 2020, and December 15, 2022, minutes of the meetings are included in Appendix A.

2. Policy Framework and Design Criteria

2.1 Policy Framework and Guidelines

The relevant guidelines and policies used in this report for the assessment of the Highway 413 drainage system include:

- MTO Drainage Management Manual (1997)
- MTO Highway Drainage Design Standards (2008)
- MOE (now MECP) Stormwater Management Planning and Design Manual (March 2003)
- DIR-PHM-B-014 Drainage Management Policy and Practice (Aug. 23, 2007, Rev. July 2007)
- DIR-PLNG-B-012 Drainage Act – Drainage Works and Municipal Drains (March 16, 2010)
- HSBM DCSO 2016-03 Implementing the New Unified Ontario Flood Method as the Method for Calculating the Design Flow Rates for Water Crossings (March 31, 2016)
- HSBM DCSO 2016-13 Implementation of the Ministry Update IDF Curves Online Application Version 3 (October 28, 2016)
- HSBM DCSO 2016-14 Implementation of the Ministry's Climate Change Consideration in the Design of Highway Drainage Infrastructure (October 28, 2016)
- HSBM DCSO 2020-02 Moratorium on Styrene Containing Cured-in-Place-Pipe (CIPP) Products Remains in Effect (April 2, 2020)
- HSBM DCSO 2020-03 Culvert Design Workbook Version 1.0 for MTO Culvert Design Assignments (May 12, 2020)
- Conservation Halton Guidelines for Stormwater Management Engineering Submissions (CH, November 2021)

2.2 Design Criteria

The documents listed above were reviewed to develop drainage and stormwater management criteria for the project discussed in following sections.

2.2.1 Surface Drainage System

The MTO's Highway Drainage Design Standards prescribe standards for designing Surface Drainage Systems (SD). The standards that are relevant to this study are as follows:

SD-1 Design Flows for Surface Drainage Systems: This standard identifies the minimum design flows that should be used for the highway surface drainage systems. The minor system of a freeway shall be designed for the 10-year design flow while the major system shall be designed for the 100-year design flow.

SD-2 Longitudinal Grade and Cross-fall: This standard identifies the minimum longitudinal grade and cross-fall for highway surface drainage.

SD-3 Flow Spread on to Travel Lanes: This standard identifies the maximum distance flow can spread on to the travel lanes of a highway. It also defines the maximum depth of flow at the edge of the travel lanes.

SD-4, SD-5, and SD-6: These standards identify the design of storm sewer systems, storm sewer inlets on a continuous grade, and storm sewer inlets at highway sags, respectively.

SD-9 Roadside Ditches (Conveyance Only): This standard outlines the minimum design requirements of Roadside Ditches for the conveyance of flow. It does not address the design of roadside ditches for enhancement of water quality.

SD-12 Freeboard above Adjacent Watercourse or Water Bodies: This standard identifies the minimum required freeboard for roadways that are constructed adjacent to watercourses or water bodies.

SD-13 Design Flow and Freeboards for Culverts not on a Watercourse: This standard identifies the design flows and the required freeboard for culverts associated with runoff from roadways and local external catchment areas. Culverts under highways, ramps, and adjacent roadways shall be designed to convey the minor and major systems design flow.

2.2.2 Hydraulic Criteria

The MTO's Highway Drainage Design Standards prescribe standards for designing Water Crossings (WC). The standards that are relevant to this study are as follows:

WC-1 Design Flows (Bridges and Culverts): This standard identifies the minimum design flows for the sizing of bridges and culverts for flow conveyance on regulated and non-regulated watercourses.

For the design flow, Highway 413, Transitway and associated ramps are considered as Freeway and all culverts and bridges will be designed in accordance with the design flow stipulated in the above table.

Regulatory flow will be calculated for all regulated watercourses where Floodline Mapping is available, where there is a potential risk to public safety, or where there is potential damage to adjacent properties. The existing and proposed upstream water surface elevations shall also be calculated for Regulated Watercourses where the Regulatory Flow estimate is required to assess the impacts of the proposed crossings.

WC-2 Freeboard and Clearance at Bridge Crossings: This standard identifies the soffit clearance and freeboard for bridges.

WC-4 Bridge Deck Drainage: This standard identifies the Maximum Allowable Spread Distance onto the travel lanes of highway bridges. It also defines the Maximum Depth of flow at the edge of the travel lanes.

WC-5 Bridge Deck Drains: This standard identifies the requirements for drains in bridge decks.

WC-7 Culvert Crossings on a Watercourse: This standard identifies the minimum freeboard, minimum clearance, and the maximum flood depth at culvert crossings.

WC-8 Minimum Culvert Size: This standard identifies minimum culvert sizes for various road types. The minimum culvert size to be used under freeways and urban arterials is 800 mm diameter for circular culverts and 900 mm rise for box culverts.

WC-12 Fish Passage through Culverts: This standard identifies requirements to facilitate Fish Passage through Culverts on fish bearing streams. The standard defines the width of the culvert, embedment depth, substrate materials to be used, and shape of the low flow channel within the culvert.

The minimum design criteria for the design of watercourse crossings are summarized in **Table 2.1**.

Table 2.1: Design Criteria (Bridges and Culverts)

Functional Road Classification	Bridge and Culverts ¹ Design Flow Total Span up to 6.0 m	Bridge and Culverts ¹ Design Flow Total Span over 6.0 m	Bridge and Culverts ¹ Check Flow	Bridges ² Freeboard (m)	Bridges ² Clearance (m)	Culverts ³ Freeboard (m)	Culverts ³ Clearance ⁴ (m)	Flood Depth Criteria (HW/D Ratio)
Freeway	50-year	100-year	130% of 100-year	≥1.0 m	≥1.0	≥1.0	≥0.3	■ Culverts with diameter or rise <3.0 m ■ HW/D ≤ 1.5 ■ Culverts with diameter or rise 3.0 to 4.5 m ■ HW ≤ 4.5 m ■ Culverts with diameter or rise >4.5 m ■ HW/D ≤ 1.0
Urban Arterial								
Rural Arterial	25-year	50-year	115% of 100-year	≥1.0 m	≥1.0	≥1.0	≥0.3	
Collector Road								
Local Road	10-year	25-year	100% of 100-year	≥ 0.30 m	≥0.3	≥0.3	≥0.3	

Note: 1. Standard WC-1 MTO Drainage Design Standards, January 2008;
 2. Standard WC-2 MTO Drainage Design Standards, January 2008;
 3. Standard WC-7 MTO Drainage Design Standards, January 2008; and
 4. Open footing with erodible bottom only.

2.2.3 Stormwater Management Criteria

The Stormwater Management Criteria for the project is based on the MTO's Highway Design Standards (MTO, 2008), Stormwater Management Planning and Design Manual (MOE, now MECP, March 2003) and Conservation Halton Guidelines for Stormwater Management Engineering Submissions (CH, November 2021) as described below.

The MTO's Highway Drainage Design Standards prescribe standards for the design of stormwater management (SW) best management practices. The standards that are relevant to this study are as follows:

SW-1 Stormwater Management-Level of Control: This standard identifies the level of control requirements for the design of stormwater management facilities for highways.

SW-2 Stormwater Management Ponds: This standard identifies design standards for the design of stormwater quantity and quality pond components (wet, wetlands and dry).

SW-3 Roadside Ditches for Water Quality: This standard provides the minimum design requirement for Roadside Ditches to achieve water quality control.

Conservation Halton Guidelines for Stormwater Management Engineering

Submissions (CH, November 2021): This document identifies CH's regulatory and technical requirements for submission and outlines CH's key expectations for SWM design. Summarized below is CH's SWM criteria and objectives for water quantity, quality, stream erosion and water balance:

- **Treatment Train** – Use of a treatment train approach is encouraged, and may be required, to meet multiple SWM objectives.
- **Water Quantity** – In the absence of current higher-level studies, control post-development flows to pre-development levels for 1:2-year through 1:100-year storm events. Overcontrol may be required where downstream capacity constraints exist. Provide safe conveyance of Regulatory Storm from a SWM facility.
- **Water Quality** – Provide minimum 80% Total Suspended Solids (TSS) removal to an Enhanced (formerly Level 1) standard of treatment unless alternative criterion has been established.
- **Stream Erosion Control** – Use 24-hour detention of the 25 mm storm, where an erosion study is not required.
- **Water Balance** – Consult with CH regarding feature-based water balance requirements.

Stormwater Management Planning and Design Manual (MOE, now MECP, March 2003): This manual provides technical and procedural guidance for the planning, design, and review of stormwater management practices.

Based on the above, the overall stormwater management criteria for the proposed Highway 413 project are summarized below:

- **Quantity Control** – Control post-development peak flows to pre-development levels for all storms up to and including the 100-year storm.
- **Water Quality** – Enhanced level of protection i.e., 80% total suspended solids (TSS) on long-term basis.
- **Erosion Control** – For sites with SWM ponds, detain runoff generated from a 25 mm storm for 24 hours.
- **Water Balance** – Best efforts to maintain groundwater recharge and hydrologic regimes.

3. Methodology and Approach

This section discusses the general methodology and approach considered for the overall project study area as well as general methodology specific to the subject conservation authority section.

3.1 Hydrology

The foundation for the Drainage and Hydrology design will be based on a review of the existing documentation including, among others, the Highway 413 Transportation Corridor – Stage 1 study material, MTO contract documentation, development reports, and hydrologic reports within the study area. Generally, where approved sub-watershed models are available for use, flows will be referenced and verified. Where existing models are not available, flows will be determined based on the site applicability of the following hydrologic techniques: Visual Otthymo (VO), Rational Method for areas less than 20 hectares, and the Unified Ontario Flow Method (UOFM) for areas greater than 20 hectares.

Based on the previous work completed for CH Section in the Highway 401 Expansion Project, it was determined that the Visual Otthymo model is appropriate for use considering the design requirement.

3.2 Hydraulics

The general methodology established for this project is to obtain existing hydraulic models from Conservation Authorities, verify and use them in the hydraulic assessment for the required watercourses crossings under the proposed Highway 413. Where models are not available, CulvertMaster hydraulic model was used in the assessment of existing and proposed culvert crossings.

For the CH Section of the project, most of the watercourse crossings were assessed using CulvertMaster except for the East Sixteen Mile Creek crossing, also identified in this report as SM_EB_SIM_01_WC1 (MTO Site No. 10x-0081/CO). Considering that this crossing was recently replaced in 2020, as part of the Highway 401 Expansion Project, the latest HEC-RAS model as provided in that project was used in the hydraulic assessment of the East Sixteen Mile Creek crossing. The model was updated to represent existing and proposed conditions, and water levels were referenced from the output.

Hydraulic assessments were completed only for the existing watercourse crossings that require extensions and proposed new watercourse crossings. Internal highway drainage (micro drainage) was identified but hydraulic assessment will be deferred in the subsequent design stage.

Further discussion on the hydraulic modeling completed for the CH section of the project is provided in **Section 8**.

3.3 Stormwater Management

The stormwater management methodology and approach considered in preparing a preliminary stormwater management strategy for the proposed Highway 413 includes the following:

- Existing drainage patterns are to be maintained as much as possible given the preferred layout of the Highway 413 Transportation Corridor and profile.
- Runoff from areas external to the proposed Highway 413 Transportation Corridor Right-of-Way (ROW) will be intercepted and conveyed directly to the watercourse.
- The drainage area considered for stormwater management consists of the Highway 413 Transportation Corridor ROW, which includes the highway and the proposed transitway in their ultimate condition. It was assumed that separate stormwater management controls will be provided for future transitway stations and maintenance yards and therefore not considered at this stage.
- Where the proposed highway drainage area exceeds 10 hectares, or significantly impact the receiving system, stormwater management ponds will be provided for water quality and quantity controls. Where highway catchment areas are less than 10 hectares, or the impact on the downstream system is insignificant, engineered swales with check dams will be used to mitigate potential impacts.
- Where stormwater management measures are currently provided, assessment should include verifying the impact to existing SWM measures and providing preliminary modification and or improvements recommendations as required.
- Enhanced (80% TSS removal) level of protection will be provided only for the new impervious and pavement areas.

It is noted that under existing conditions, stormwater management measures are provided for Highway 401 / 407 interchange. These measures include six wet ponds, flow control structures, as well as ditches and swales. Several of these existing SWM features will be impacted by the proposed improvements, and will require modification, improvement, or relocation which accounts for the additional run-off and pollutant load resulting from additional ramps and revised ramp configurations to connect Highway 401 and Highway 407 to the proposed Highway 413. New stormwater management ponds will also be provided to mitigate potential impacts to existing watercourse crossings and recipient drainage downstream of the study limit.

4. Existing Conditions Drainage

The existing highway transportation corridor crosses tributaries of the Sixteen Mile East Branch and the Sixteen Mile Creek East Branch Lisgar as shown on **Figure 4.1**. The CH section of the study area includes the existing Highway 401 and Highway 407 interchange and associated ramps. **Figure 4.1** also shows the existing drainage features as well as the approximate regulatory limits and sub-watershed boundaries obtained from CH. It should be noted that a section of the original East Branch subwater-shed catchments located northwest of Eight Line and Highway 401 has been previously altered and diverted to the south, and currently drains towards a tributary of one of the East Branch Lisgar tributaries.

The area adjacent to the highway corridor is predominantly farmland and improved lands with some small industries and rural residential and natural areas, with the overall drainage pattern from northwest to southeast. These adjacent lands are undergoing extensive developments with lands southeast of the CH Study are already fully developed.

As noted in **Figure 4.1**, the existing Highway 401, Highway 407, and associated ramps traverse six minor and major tributaries of the Sixteen Mile Creek, the largest being the main Sixteen Mile Creek East Branch located east of Trafalgar Road. Several watercourse culvert crossings and stormwater management ponds have been previously constructed during the Highway 401 and Highway 407 developments in the 1950s and 1990s, respectively. The most recent development occurred in 2020-2022 with the widening of Highway 401 as part of the Highway 401 Expansion project. As part of this recent highway improvement, several existing watercourse crossings were recently replaced, and stormwater management measures were implemented. **Table 4.1** list the existing watercourse crossings within the study area which may be impacted by the proposed Highway 413 construction.

There are six stormwater management ponds (Pond 1 through Pond 6, see **Figure 4.1**) that provide quality and quantity controls for the existing Highway 401 and 407 Interchange area. Out of the six ponds, three ponds (Pond 1, Pond 3 and Pond 6) will be impacted by the proposed works and would require relocation and modification.

** - “w x d/rise” is the actual culvert width and depth/rise, while “(w x d / rise)” is the net culvert opening, width and net depth/rise considering embedment.

5. Proposed Conditions Drainage

Under the proposed condition, the Highway 413 Transportation Corridor will be constructed in stages, initial or interim conditions and the ultimate conditions. The typical highway cross-sections (in stages) of the proposed highway are shown in **Figure 5.1**.

Under the initial construction plan, the proposed highway will consist of 6 lanes (three lanes in each direction) with an open median in the middle and a two lane transitway. The proposed highway will consist of a rural cross section that conveys flows entirely through a series of roadside ditches and culverts. The highway runoff will be collected and conveyed through median and side ditches, and discharged to the adjacent creeks. The proposed transitway will also have a rural cross section and drain through a series of ditches and culverts. In future expansions or ultimate conditions, the highway will be widened to the middle and will consist of 8 lanes and 2 HOV lanes and a two lane transitway. The open median ditch will be replaced with an underground storm sewer to collect and convey storm runoff to the proposed stormwater management ponds / ditches and ultimately to the nearby creeks. This report addresses the ultimate conditions for property acquisition purposes.

Figure 5.2 shows the proposed drainage conditions highlighting the Highway 413 ultimate condition layout plan including the proposed Highway 401, Highway 407 and Highway 413 interchange, existing watercourse crossings and corresponding sub-watershed boundaries.

Figure 5.3 shows the general drainage plan, identifying the existing 18 watercourse culverts that will potentially be impacted by the proposed development along with proposed crossings to convey flows across the transportation corridor within the study limit. Of the 18 existing culverts, 14 will potentially require extension, modification or relocation. In addition to the existing culverts, 12 new watercourse culvert crossings will be required to convey highway and external drainage.

The existing six stormwater management ponds (Pond 1 through 6), are also shown on **Figures 5.2** and **5.3**. Ponds 1, 3 and 6 will be impacted by the new interchange ramps, requiring relocation or modification. It is anticipated that Ponds 2, 4, and 5 will not be significantly impacted by the proposed works. Three additional stormwater management ponds (Ponds 7, 8 and 9) will be required to mitigate potential impacts to the existing highway drainage and downstream recipient watercourses and municipal drainage.

Figure 5-1: Typical Highway 413 Cross Section

Figure 5-2: Proposed Drainage Conditions

Figure 5-3: Proposed Drainage Plan

6. Geomorphic and Environmental Requirements

Geomorphic assessment was completed for the watercourse crossings along the proposed Highway 413 and will be compiled in a separate report. Similarly, the ecology team completed field investigations for all watercourse crossings and their findings will be documented in a separate report. The geomorphic requirements are summarized in **Tables 6.1**, the fish habitat and wildlife requirements are summarized **Table 6.2** below.

Table 6.1: Geomorphic Requirement Summary

7. Hydrologic Assessment

7.1 Watersheds

As noted in **Section 4**, a segment of the proposed Highway 413 Transportation Corridor is within the Sixteen Mile Creek Sub-Watershed regulated by Conservation Halton (CH). The Sixteen Mile Creek watershed is about 360 square kilometers that includes both rural and urban land uses and drains parts of Halton Hills, Milton, Mississauga, and Oakville, ultimately discharging to Lake Ontario. The proposed development lies within the eastern limit of the sub-watershed, in the East Branch and East Branch Lisgar catchments in the municipalities of Milton, Halton Hills and Mississauga. **Figures 4.1** and **5.2** shows the existing sub-watershed boundaries and the Sixteen Mile Creek Tributaries traversing the existing highway and the proposed development.

7.2 Rainfall Data

The rainfall information used in the hydrologic assessment was obtained from the MTO IDF Curve Lookup, a web-based application provided by MTO for the purpose of retrieving Intensity-Duration-Frequency (IDF) curves and for use in MTO projects.

Table 7.1 shows the return period rainfall amounts (mm) during 6-hour, 12-hour and 24-hour storm durations for the 2021 IDF (design analyses start date) and for the future 2096 IDF, assumed at the end of design service life of 75 years. It was estimated that the 50-year and 100-year rainfall amounts would increase by approximately 8% at the end of the design service life of the proposed drainage infrastructures. This 8% increase for climatic change scenario is applied only to the flows used in CH's HEC-RAS model for water crossing SM_EB-SIM_0_WC1 where no hydrologic modeling was completed for this study. For the remaining crossings hydrologic modeling was completed and 2096 IDF was used to determine flows for the future year at the end of design service life of 75 years.

Table 7.1: Rainfall Data

Duration	Depth, mm (2021 MTO IDF)						Depth, mm (2096 MTO IDF)					
	Return Period						Return Period					
	2-year	5-year	10-year	25-year	50-year	100-year	2-year	5-year	10-year	25-year	50-year	100-year
6 hour	38.4	50.4	58.8	68.4	75.6	83.4	43.8	55.8	63.6	73.8	81.0	88.2
12 hour	48	62.4	72	84	93.6	103.2	55.2	69.6	79.2	92.4	100.8	110.4
24 hour	57.6	76.8	88.8	103.2	115.2	127.2	69.6	86.4	100.8	115.2	124.8	136.8

The MTO IDF Curve Lookup outputs for 2021 IDF and 2096 IDF are provided in **Appendix B**.

7.3 Hydrologic Modeling

Hydrologic modelling was completed for all watercourse crossings within the CH area study limit to determine peak flow rates required for the watercourse crossing assessments, hydrologic impact assessments and stormwater management pond sizing. As noted in **Section 3.1**, it was determined that the Visual Otthymo (VO) hydrologic model is appropriate for use considering the design requirements and previous work completed in the area.

Figures 7.1 and **7.2** shows the catchment discretization for existing and proposed conditions, respectively. Catchments were delineated using the latest topographic data considering the current Highway 401 expansion design and approximate ROW limits. Hydrologic Reference Points (HRPs) and Outlet locations, as shown in **Figures 7.1** and **7.2**, were also identified for use in impact assessment and stormwater management calculations.

A VO scenario model was set-up for each corresponding outlet as shown in the schematic diagrams in **Appendices C.1, D.1** and **E.1**. The input parameters and associated calculations are provided in **Appendix C.2** for existing conditions and **Appendix D.2** for proposed conditions.

As previously identified in the sensitivity analysis completed for the Highway 401 Expansion project, the SCS Type II 24-hour storm distribution and duration would yield the most conservative flow estimates for the CH section study area and was accordingly adopted for the hydrologic assessment.

Figure 7-1: Drainage Mosaic - Existing Condition

Figure 7-2: Drainage Mosaic - Proposed Condition

7.4 Modeling Results

7.4.1 Watercourse Crossings

Hydrologic simulations were conducted for all watercourse crossings except crossing SM_EB_SIM_0_WC1 and the results are summarized in **Table 7.2**. The peak flow rates for crossing SM_EB_SIM_0_WC1 (MTO Site 10X-0081/C0) were taken from hydraulic model provided by CH. These flows were originally taken from the CH HEC-2 model FOAK17.DAT, the same data provided by CH in 2021 for use in this project. The future flows used (2096 IDF) for this crossing were estimated by adding 8% (increase in precipitation as discussed in **Section 6.2**) to the existing flow to account for the climatic change scenario for the future at the end of design service life (2096).

The peak flows, as summarized in **Table 7.2**, were used in the assessment of existing watercourse crossings' hydraulic performance and hydraulic impact assessments of the proposed culvert extensions as well as future hydraulic performance considering Climate Change at the end of service life (2096 IDF). The Regional storm flows were based on the existing AMC III soil conditions without pond storage and utilizing the Hurricane Hazel storm distribution.

Table 7.3 summarizes the proposed conditions uncontrolled peak flows for the proposed watercourse culvert crossings as well as the Regional storm flow and the future peak flows using the 2096 IDF. The peak flows, as summarized in **Table 7.3**, were used to size the new watercourse crossings considering 2021 IDF and 2096 IDF. The Regional storm flows were based on the existing condition AMC III soil conditions without pond storage and utilizing the Hurricane Hazel storm distribution.

The Visual Otthymo (VO) hydrologic modeling output for existing and proposed conditions is provided in **Appendix C** and **Appendix D**, respectively.

7.4.2 Hydrologic Impact at HRPs

A hydrologic assessment was also completed for the study area to assess the increase in peak flow rates resulting from the proposed works. Mitigation measures in the form of new or modified stormwater management ponds are proposed to reduce the impact of proposed works.

Table 7.4 shows a comparison of the existing conditions peak flows and uncontrolled proposed conditions peak flows at each HRP and watercourse outlet. As noted in **Table 7.4**, the increase in peak flow rates at Outlets 2 and 6 is insignificant and therefore flow attenuation is not required. The proposed flow attenuation measures and stormwater management strategy is discussed further in **Section 9**.

The Visual Otthymo (VO) hydrologic modeling output for existing conditions is provided in **Appendix C**. The VO model output for proposed uncontrolled conditions is in **Appendix D**.

Notes: 1 - See Figures 6.1 & 6.2 for location / 2. See VO Schematics in Appendix C.1 / 3. See VO Schematics in Appendix D.1

8. Hydraulic Assessment

8.1 Hydraulic Modeling

Hydraulic assessment was completed for all watercourse crossings within the study limits. As noted in **Table 2.1** in **Section 2**, the conveyance and peak flow criteria were based on the roadway classification. The existing Highway 401, Highway 407 and the proposed Highway 413 are classified as Freeway highways, and therefore for crossing spans less than 6 m, the design flow is the 50-year storm while for spans greater than 6 m, the design flow is the 100-year.

The majority of the existing and proposed crossings have spans less than 6 m, therefore, the design flow is the 50-year storm. For crossings SM_EB_SIM_0_WC1 (MTO Site 10X-0081/C0) and SM_EB_SIM_1_WC2.2, the design flow is the 100-year event.

For crossing SM_EB_SIM_0_WC1 (MTO Site 10X-0081/C0), the updated HEC-RAS model as provided in the Highway 401 Expansion project was utilized and further updated to generate existing conditions and proposed conditions models appropriate for the site. All other watercourse crossings were assessed using Bentley's CulvertMaster hydraulic modeling software program.

Utilizing the peak flows summarized in **Tables 7.2** and **7.3**, the crossings were analyzed for the 50-year, 100-year, Check Flow and Regional storm, where applicable. Hydraulic performance of each crossing was determined based on minimum freeboard, flood depth (headwater depth and rise) ratio and overtopping. As noted in **Table 2.1**, the minimum design flow freeboard is 1.0, while maximum headwater depth and rise ratio (HW/D) is 1.5. Overtopping criteria is based on the 100-year, Check Flow and Regional storm, where applicable.

The tailwater condition was assumed as 60% of the pipe rise or depth where backwater was not considered to be an issue. In areas where a culvert outlet is in close vicinity to an existing water body, it was assumed that the tail water would be at the obvert of the culvert or known water elevations.

8.1.1 Existing Watercourse Crossings

Figures 4.1, 5.2 and **5.3** shows the existing watercourse crossings within the CH study limit. As identified in **Section 4** and listed in **Table 4.1**, there are approximately 18

culverts that will potentially be impacted by the proposed Highway 413 and associated works. A high-level review indicates that 4 of these culverts potentially do not require any extension/rehabilitation works and therefore were not included in the hydraulic assessment but should further be confirmed in the subsequent design phase when more information is made available. Two of these culverts will require removal and relocation, 3 will potentially require structural modification and 9 culverts will require extension.

The following culverts (Refer **Figure 5.3** in **Section 5**) will potentially require structural modification / extension or removal but are not included in the hydraulic assessment and will require further assessment in the subsequent design stage:

- SM_EB_SIM_1_WC1.4 at Highway 401 13+578. The south section of this culvert could potentially be impacted by the proposed Highway 401 West to Highway 413 North Ramp embankment. Partial removal of the south section and a skewed extension to the southwest will be potentially required.
- SM_EB_SIM_1_WC3.4 (MTO Site 10+544C) at Highway 401 14+489. This culvert currently drains to Pond 3; however, the south section of this culvert will be impacted by the proposed re-alignment of Highway 413 / 407 North / South to Highway 401 East Ramp preventing drainage to Pond 3, which will also require modification. Partial removal of the downstream section and providing a new culvert (SM_EB_SIM_1_WC3.5) connection for efficient hydraulic connection is recommended.
- SM_EB_SIM_1_WC3.6 at Highway 401W - 407E Ramp 10+380. This culvert serves as a flow by-pass and outlet for existing Pond 3. It will be in conflict with the proposed bridge abutment and embankments, and will require removal and relocation.
- SM_EB_SIM_1_WC4.1 (MTO Site 10-555C) at Highway 401 15+079. This culvert serves as a by-pass outlet from Highway 407 upstream drainage and the existing Pond 4 outlet. This culvert will require additional information to confirm if extension can be avoided. The preliminary recommendation is to avoid extension as much possible to avoid impacting the Pond 5 outlet as well as the by-pass channel to the culvert.
- SM_EB_SIM_1_WC5.1 (MTO Site 10-559C) at Highway 401W – 407 E Ramp 11+129. This culvert serves as overflow culvert from Pond 3 to Pond 5 and potentially impacted by the proposed re-alignment and re-grading of the Highway 401W to 407 E Ramp. This culvert will potentially require extension or modification, to be confirmed in the subsequent design stage.

The following culverts (Refer **Figure 5.3** in **Section 5**) will not require any culvert extension / improvement works and need to be confirmed further in the subsequent design stage when detailed information is made available:

- SM_EB_SIM_2_DR1 at Trafalgar Road S to 401 W Ramp 9+950.
- SM_EB_SIM_2_DR2 at Trafalgar Road S to 401 E Ramp.
- SM_EB_SIM_5_WC1.1 at Highway 401 WB Collector Initiation.
- SM_EB_SIM_1_WC1.3 at Highway 407 E - 401 W Ramp. This culvert will not be significantly impacted by the proposed works. Flow attenuation will be provided upstream through proposed Pond 8 to mitigate potential hydraulic impact.

Three additional culverts not listed in **Table 4.1**, that directs flow to Pond 2, will not to be significantly impacted by the proposed works since these culverts are outside the proposed highway grading limits. Flow attenuation will be provided upstream through the proposed Pond 9 to mitigate potential hydraulic impact to the culverts and Pond 2.

A hydraulic assessment was completed for the culverts that require extension. The existing culvert data (inverts, length) were taken from existing drawings. For the proposed extensions, extension lengths were assumed based on grading limits maintaining the existing slope, where feasible. Results of the assessment are provided in **Section 8.2**.

8.1.2 Proposed Watercourse Crossings

In addition to the existing culverts discussed above, 12 new watercourse crossings (refer to **Figure 5.3** in **Section 5**) are being proposed to convey run-off from upstream drainage and the proposed Highway 413 and the expanded Highway 401, 407 and 413 interchange drainage. They are sized according to the hydraulic modeling methodology discussed above with results provided in **Section 8.2**. below.

For the internal highway drainage (micro drainage), also identified in **Figure 5.3**, hydraulic assessment will be deferred in the subsequent design stage. As a preliminary estimate, a minimum 900 mm diameter culvert is anticipated to provide sufficient conveyance capacity.

8.2 Modeling Results

The results of the hydraulic assessment completed for the existing and proposed watercourse crossings are summarized in **Tables 8.1-8.5**.

Table 8.1 summarizes the hydraulic performance of the existing watercourse crossings requiring extension. As noted in the table, all culverts satisfy all hydraulic requirements under existing conditions.

Table 8.2 summarizes the proposed hydraulic performance of the existing watercourse crossings with extensions. As noted in the table, all culverts satisfy all hydraulic requirements under proposed conditions.

Table 8.3 summarizes the hydraulic impact of the proposed extension of existing watercourse crossings. As noted in the table, the proposed extensions will result in an increase in the headwater elevations, ranging from 0.01 m to 0.14 m. The increase in flood elevations for the majority of these culverts is within the MTO right-of-way except for the East Sixteen Mile Creek crossing identified as SM_EB_SIM_0_WC1 (Site No.10X-0081/C0), where the Regional storm headwater elevation will increase by 0.11 m and will extend beyond the MTO right-of-way.

Table 8.4 shows a comparison of the water surface elevations from the upstream and downstream river stations of East Sixteen Mile Creek crossing identified as SM_EB_SIM_0_WC1 (MTO Site No.10X-0081/C0). As noted in the table, the Regional Storm water level is increased by a maximum 0.11 m extending from the upstream face of the culvert up to Steeles Avenue where the increase in flood elevation is dissipated, approximate 1 km upstream of the culvert. It should be noted, however, that the East Sixteen Mile Creek is in a deep valley and the proposed water level increase will be contained within the valley.

Table 8.5 summarizes the hydraulic performance of the proposed new watercourse crossings. As noted in the table, all proposed culverts satisfy all hydraulic requirements.

Table 8.6 summarizes the hydraulic performance of all existing and proposed new watercourse crossings considering climate change at the end of the design service life (2096 IDF). As noted in the table, all existing and proposed culvert crossing satisfy all hydraulic requirements during future conditions (2096 IDF).

The CulvertMaster output for culverts under existing conditions is included in **Appendix G.1** and proposed conditions in **Appendix G.2**. The CulvertMaster output for future conditions (IDF 2096) is provided in **Appendix G.3**.

The HEC-RAS modelling output for East Sixteen Mile Creek watercourse crossing SM_EB_SIM_0_WC1 (Site No.10X-0081/C0), is provided in **Appendix F**.

8.3 Summary of Watercourse Crossing Hydro-Technical Recommendation

Table 8.7 summarizes the preliminary hydro-technical recommendations based on the results of the hydrologic and hydraulic assessments completed for the culverts within the CH study limits. It summarizes the minimum hydraulic opening requirements as well as the preliminary slope, assumed extension length and new culvert length. As indicated in **Table 8.7**, 9 existing culverts will require extensions and 12 new culverts will be required to convey flows across the proposed highway corridor. The existing and proposed crossing culverts as well as internal micro-drainage are identified in **Figure 5.3**. It is anticipated that a 900 mm minimum diameter culvert will have sufficient capacity to convey the anticipated flows. Their sizes will be further confirmed in the subsequent design stage.

8.4 Geomorphic and Environmental Considerations

Table 8.8 summarizes the watercourse crossing recommendations considering hydraulic, geomorphic, and environmental requirements. It should be noted that majority of the crossings are existing, therefore, the recommended sizes were governed by hydraulic requirements except for watercourse crossings SM_EL_SIM_1_WC1.1 and SM_EL_SIM_1_WC1.2. The recommended sizes for these two crossings were governed by the environmental requirement for openness ratio.

Considering also that majority of the watercourses are either direct or indirect fish habitats, a minimum 300 mm substrate was added in the recommended culvert sizes as required by MTO's 2008 HDDS WC-12 Fish Passage through Culverts.

Table 8.7: Summary of Preliminary Watercourse Crossing Hydro Technical Recommendations

9. Stormwater Management

Runoff from the proposed Highway 413 Transportation Corridor will discharge to a combination of intermittent, ephemeral, and permanent watercourses and to municipal sewer systems which could potentially be impacted. Potential impacts to the receiving watercourses and municipal sewer system are addressed by the proposed stormwater quality treatment and quantity control measures discussed as follows.

9.1 Potential Impacts of Proposed Highway 413

The proposed Highway 413 Transportation Corridor will result in an increase in impervious and pavement area. The total increase in pavement areas within the CH study limit is approximately 31 ha which could increase pollutant loading and peak flow rates. This will potentially impact the receiving watercourses, municipal sewer systems, existing highway culvert crossings and stormwater management ponds. As noted in **Figure 5.2** and **5.3**, three existing stormwater management facilities (Ponds 1, 6 and 3) will be impacted by the proposed works and will require relocation and or modification.

To quantify the potential impacts of the proposed Highway 413 improvements on the water quality and quantity of downstream drainage systems, an impact analysis was completed at each hydrologic reference point (HRP) and outlet. For HRP and outlet locations, refer to **Figures 7.1** and **7.2**.

Table 7.4 in **Section 7.4.2** provides the results of the hydrologic impact assessment at each HRP and outlets. **Table 9.1** provides a summary of potential impacts at each outlet and recommended stormwater management strategy to mitigate the impacts.

9.2 Screening of Alternatives

A list of stormwater best management practices (BMPs) was screened, with consideration of the general advantages and disadvantages, experience, and practical feasibility for the site-specific conditions, such as:

- Integration with the standard type of drainage (storm sewers and outside ditches).
- Space availability and practical outlet points.
- Functionality of using small orifice sizes to control discharge rates; and
- Future integration/replacement with future SWM plans for the developed lands.

It was determined at the start of the study that the “do nothing” alternative is not an acceptable course of action. The proposed increase in pavement area and the associated potential increase in pollutant loading to the receiving watercourses would result in negative effects such as reduced stream water quality, degraded aquatic habitat, flooding, and in-stream erosion, which necessitate provision of appropriate mitigation measures. To reduce the potential impacts of the proposed works, a treatment train approach is recommended that utilizes a combination of source, conveyance, and end-of-pipe practices.

The MECP has identified a broad range of SWMPs that may be considered for the proposed Highway 413 Transportation Corridor. The recommended practices that can be implemented as part of this project are:

- Dry linear facilities providing quantity control.
- Vegetated grassed swale providing quality treatment and quantity control.
- Special SWMPs such as oil and grit separators to provide quality treatment.

Storage SWMPs such as wet ponds, dry ponds, linear SWM facilities, can be effective in providing combined quality treatment and/or quantity control where drainage areas are sufficient, and space is available.

9.3 Quantity Control

The proposed highway improvements will result in an increase in pavement area, which could potentially lead to an increase in peak flows. **Table 9.1** summarizes the proposed water quantity control strategy to mitigate the potential increases in peak flow rates.

As discussed in **Section 2.2.3**, the quantity control criterion is to control the post-development peak flows to pre-development levels for all storms up to and including the 100-year storm (i.e., 2, 5, 10, 25, 50 and 100-year storms) for all watercourses within the study area. This will be achieved through the following stormwater management measures:

- Maintain existing Pond 2, Pond 4 and Pond 5
- Relocate Pond 1
- Relocate and increase Pond 6 capacities
- Modify Pond 3.
- Provide three new Wet Ponds (Pond 7, 8 and 9)

Table 9.1: Summary of Highway Drainage Impact and SWM Strategy

Outlet No	Total Drainage Area (ha)	Estimated Highway Pavement Area (ha)				Hydrologic Impact		Outlet Description	SWM Strategy	
		Existing Condition	Proposed Condition	Pavement Area Increase		Peak Flow Increase m³/s	Remarks		Quantity Control	Quality and Erosion Control
				Increase (ha)	Increase (%)					
1	2,105.8	14.5	20.5	6.1	42%	0.91 - 1.07	■ Significant Impact	■ Wetland	■ Wet Pond	■ Pond 7 ■ Existing Ditches
2	34.9	6.0	5.8	0.0	0%	0	■ No impact.	■ Farmland ditches	■ Not Required	■ Ditch swale
3	20.4	5.0	6.3	1.4	28%	0.18 - 0.60	■ Significant Impact	■ Existing - Wetland to open channel ■ Proposed - Open Channel via 407 Culvert	■ Flow Diversion	■ Ditch swale
4	91.2	11.5	15.8	4.3	38%	0.01 - 0.75	■ Significant Impact	■ Open Channel	■ Wet Ponds	■ Wet Ponds ■ Ditch swale
5	72.4	11.1	26.7	15.6	141%	0.70 - 0.98	■ Significant Impact	■ Open Channel to municipal drain	■ Wet Ponds	■ Wet Ponds ■ Ditch swale
6	8.9	0.0	2.0	2.0	100%	0	■ No impact.	■ Farmland ditches to open channel	■ Not Required	■ Ditch swale
7	86.8	10.1	11.0	0.9	9%	0.07 - 0.13	■ Increase during 2-year - 10- year event only. Insignificant impact.	■ Open Channel to municipal drain	■ Existing Wet Pond	■ Existing Wet Pond ■ Ditch swale
8	65.3	5.6	6.2	0.5	9%	0.05	■ Increase during 2-year event only. Insignificant impact.	■ Open Channel to municipal drain	■ Existing Wet Pond	■ Existing Wet Pond ■ Ditch swale
9	56.7	0.9	1.1	0.2	27%	0	■ Not modeled. Insignificant pavement area increase.	■ Open Channel to municipal drain	■ Existing Wet Pond	■ Existing Wet Pond ■ Ditch swale
Total		64.5	95.4	31.0	48%					

The existing Pond 2 and Pond 5 will not be significantly impacted by the proposed works and will continue to function as constructed. This decision needs to be further confirmed in the subsequent design stage when more information is available.

Table 9.2 shows a comparison of the peak flows under existing and proposed conditions with the proposed stormwater management facilities in place. As noted in the table, the anticipated increases in peak flow rates that could potentially impact the existing highway culvert crossings, existing SWM ponds, receiving watercourse and municipal sewer system systems have been mitigated..

The Visual Otthymo modelling outputs for the proposed condition with the proposed SWM ponds in place are provided in **Appendix E**.

9.4 Quality Control

An enhanced level of storm water treatment was identified for the study area. This is the highest level of treatment (80% removal of total suspended solids) identified in the MECP SWM Planning and Design Manual (2003). This criterion will be achieved through existing and proposed SWM facilities and grassed swales with check dams for the proposed impervious and pavement areas of 31 ha.

Table 9.3 summarizes the result of the water quality assessment based on a weighted treatment rate considering the proposed treatment train approach.

Table 9.2: Comparison of Peak Flows – With Stormwater Management

Note: 1. According to the MTO document entitled “The Effectiveness of Grass-Lined Highway Embankments and Ditches in Improving Water Quality”, June 2007, a minimum 40 m of ditches/swales could provide 50% removal efficiency rate.

9.5 Erosion and Sediment Control

Flat bottom ditches offer water quality control and space to incorporate check dams to reduce velocities where required. Additionally, flat bottom grassed swales are designed to reduced flow velocities and to promote sedimentation. Both measures are particularly applicable for highway applications due to their linear nature. However, specific design criteria must be achieved as discussed in **Section 2.2**.

Flat bottom swales are proposed along the east, west, north, and south side of the proposed highway and associated ramps. The bottom width is selected based on the available land and grading constraints to maintain the swale within the MTO Right-of-Way. In addition, in areas where swales are in the proximity of wetlands, they were designed as shallow as possible to minimize adverse impacts to ground water levels in the wetlands.

9.6 Proposed Drainage and SWM Facilities

The following summarizes the proposed drainage and stormwater management practices (SWMPs) proposed along the proposed highway.

9.6.1 Stormwater Management Ponds

Within CH's jurisdiction, three existing ponds (Pond 2, Pond 4 and Pond 5) needs to be maintained, three existing ponds (Pond 1, Pond 3 and Pond 6) needs to be relocated and three new ponds (Pond 7, Pond 8 and Pond 9) are proposed along the Highway 413, Highway 401, and Highway 407 Interchange Corridor. These ponds are designed as Wet Ponds which will provide the required quality, quantity, and erosion controls. The proposed impervious area is based on the ultimate design scenario. The required quality storage and quantity storage of these ponds are summarized in **Table 9.4** and will be further refined in the next design phase.

9.6.2 Grass Swales

Grass swales are proposed on both sides of highway, ramp, interchange loops and in the middle in the open median under the initial widening plan. These ditches / swales will be designed as flat bottom with check dams and will collect, treat, attenuate, and convey storm runoff generated at highway surfaces. Hydraulic design of these swales will be carried out in the next design phase, but typically these swales will have a bottom width of 1 m and 2:1 (H:V) side slope.

Table 9.4: Proposed Stormwater Management Facility Characteristics

Stormwater Management Facility ID	Drainage Area (ha)	Imperviousness (%)	Pond Characteristics						
			Quality Storage			Quantity Storage			
			Total Treatment Volume (m³/ha)		Permanent Pool Volume (m³)	Per 40 m³/ha (m³)	25 mm Storm Runoff Volume (m³)	Recommended Extended Detention Volume (m³)	100 Year Volume (m³)
			(m³/ha)	(m³)					
New Pond 7	10.10	35	140	1,410	1,006	404	2,525	1,798	3,615
New Pond 8	39.5	20	95	4,446	2,160	1,581	11,743	1,751	2,830
Existing Pond 1 Relocated	29.8	35	140	2,880	2,972	1,193	5,157	1,736	15,300
Existing Pond 6, relocated and modified	17.6	35	140	2,452	1,750	703	4,391	1,164	6,210
Pond 9	54.0	40	153	8,284	6,124	2,160	13,500	5,222	6,600
Existing Pond 3 Modified	85.3	20	95	8,075	4,663	3,413	4,265	6,664	10,800

10. Conclusions and Recommendations

This Preliminary Drainage and Stormwater Management Report is prepared in support of the proposed Highway 413 within the CH's jurisdiction for an approximately 1.3 km long segment from west of Tenth Line to Steeles Avenue as well as the proposed Highway 413, Highway 401 and Highway 407 Freeway to Freeway Interchanges and their associated ramps.

Field investigations and desktop assessments were completed to assess the existing and proposed drainage conditions of the proposed Highway 413 corridor. The potential impacts were evaluated, and a conceptual drainage plan was prepared as part of the proposed works. Based on the preceding analysis, the following conclusions and recommendations are made.

- Under the current plan, the proposed Highway 413 corridor consists of a 6-lane divided highway with an open median and a two-lane transitway. In the ultimate conditions, the proposed highway will consist of an 8 lane + 2 HOV lanes highway and two lane transitway.
- The proposed highway corridor will add approximately 31 ha of impervious cover for the ultimate conditions within the CH's study limit.
- The proposed highway corridor and associated interchange improvement will cross various watercourses and requires:
 - Extension of 9 existing watercourse crossing culverts including the East Sixteen Mile Creek Crossing
 - Fourteen new watercourse crossing culverts.
 - Structural modification or removal of 5 watercourse crossing culverts.
 - Relocation of Ponds 1 and 6.
 - Modification of Pond 3.
 - Three new stormwater management facilities Ponds 7, 8, and 9.
- Hydrologic and hydraulic assessment of the existing and proposed watercourse crossings was completed as summarized in **Tables 8.1 to 8.6**. Hydro-technical requirements are summarized in **Table 8.7** while preliminary recommendations considering Geomorphic and Environment requirements are summarized in **Table 8.8**. The proposed bridges and culverts meet the required freeboard, clearance, and overtopping criteria.

The hydraulic analysis of the existing watercourse crossings indicates that proposed extensions will have a maximum increase in flood elevations of 0.14 m. For the majority of culverts, the increase in flood elevation is within the MTO right of way except for the East Sixteen Mile Creek Crossing. The increase in flood elevation at the East Sixteen Mile Creek will be confined within the valley extends north of Highway 401 until it dissipates at Steeles Avenue. This should be further investigated at the next design stage to reduce or avoid the bend in the culvert and reduce the increase in flood elevation.

A

Agency Meeting Minutes/ Correspondence

Minutes

Meeting name Drainage consultation meeting with Conservation Halton, Consultants and MTO	Meeting date December 15, 2022	Attendees Jennifer Young, CH Jacek Strakowski, CH Lisa Jennings, CH Jessica Bester, CH Shahbaz Asif, MTO Hossein Hosseini, MTO Curtis Beyer, MTO Jonathan McGarry, MTO Brian Richert, AECOM Javeed Khan, AECOM Ana Ignacio, AECOM Rhonneke Van Riezen, AECOM Gary Epp, AECOM Tim Soroichinsky, AECOM Felipe Sapaterio, AECOM Usha Parvathy, AECOM	Jay Goldberg, WSP Gentile, Catherine, WSP Josh Tong, WSP
Time 1:00pm	Location MS Teams		
Project name Highway 413 GWP 13 20001 Assignment Number 2013-E-0008	AECOM project number 60347240		
Prepared by A. Ignacio/ B. Richert/J. Khan			

- 1) Brian Richert (BR) led the discussion attendees introduced themselves; The PowerPoint presentation is attached to these minutes.
- 2) BR discussed the agenda and started with Safety Moments regarding Safe Winter Walking.
- 3) BR went through the slide presentation, giving study overview, project status, drainage scope and showed the study area with Conservation Halton and the Freeway-to-Freeway Interchange Layout.
- 4) BR discussed the methodology and design criteria:
 - a) Hydrology for watercourse crossings were developed using Visual Otthymo (VO) considering the Highway 401 expansion design, accurately delineating the highway catchments, and utilizing the latest existing topography.
 - b) The rainfall distribution and duration used in the VO models is the SCS Type II 24-hour as already identified in the sensitivity analysis completed for Highway 401 expansion project. The rainfall data used are the 2021 IDF and 2096 IDF or climate change consideration.
 - c) The hydraulic model as used for watercourse course crossings assessments are HEC-RAS for Main East Branch of Sixteen Mile Creek and Culvert Master/HY-8 for other crossings. The crossings were sized and assessed considering the MTO Design Standard. The new crossings were sized based on proposed condition flow.
 - d) Stormwater Management Facilities were also sized based on the same VO models. Preliminary pond grading is currently on-going.
- 5) BR discussed the watercourse crossing scope showing, existing and proposed crossing locations, the existing and proposed condition catchments, how they are sized:
 - a) The crossings are within 2 sub watersheds (Sixteen Mile Creek East Branch and Sixteen Mile Creek East Branch Lisgar) and 7 tributaries.
 - b) There are 8 potential extensions including the 16 Mile Creek Culvert, 1 modification and 11 new crossings
 - c) Hydraulic minimum sizing to mee MTO Highway Drainage Design Standards, e.g., 1 m freeboard for design flood, conveyance of check flood, no flooding impact upstream and no overtopping for 100-year or Regulatory flood.
- 6) BR discussed the stormwater management scope showing the drainage outlets, general locations of proposed ponds, their catchments indicating that there are challenges in design.
 - a) There are 7 outlets within the CH study limits, drainage discharging to either watercourse or municipal drain.
 - b) There are 3 new ponds being proposed and 3 ponds that will be impacted by the proposed ramps/bridges requiring relocation or modifications.
 - c) The existing Pond 1 will be impacted by new ramps and will be relocated west of existing resulting to drainage diversion and wetland impact.
 - d) The existing Pond 6 is also impacted by new ramp; 2 alternative locations are being considered.
 - e) The existing Pond 3 will be impacted by existing ramp realignment resulting to modification of existing culvert upstream and relocation of downstream culvert and relocating the existing pond to the east.
- 7) BR discussed the following key issues:

- a) The Sixteen Mile Creek Extension – The extension will result in a maximum increase of 0.15m (6 inches) in Regulatory headwater level but is confined within the channel. The water level increase starts from Highway 401 until it is dissipated in Steeles Avenue (approximately 840m).
 - i) CH indicated that there is an on-going development upstream of Steeles avenue that could affect this branch and will need to look at the model.
 - ii) CH asked if the increased are contained within the valley. AECOM confirmed that increase is contained within the valley.
 - iii) AECOM indicated that they will get into the process of informing property owners, follow the process, and discuss with property owners.
 - iv) Lisa Jennings (LS) of CH said that there is Redside Dace upstream of Steeles Avenue. Epp Gary (EP) of AECOM indicated that there is no record of Redside Dace but will need to make sure that records will be updated. CH will provide the updated environmental data to AECOM.
 - v) EG indicated that the project is treating all wetlands as PSW and will also look if the 6-inch increase will impact wetland.
 - vi) Shahbaz Asif (SA) of MTO commented to confirm if we have used the updated model since CH is currently updating their model. SA said that MTO is also reviewing the developments upstream of Steeles Avenue. He sites the example of Culvert at Highway 401 near James Snow Parkway where they get into legal situation and gave caution that we should be using the latest model.
 - vii) AI (AECOM) said that they are using the WCC model from the Highway 401 Expansion which uses the flows from the old HEC-2 model, which was the same HEC-2 model also provided by CH in 2021.
 - viii) CH noted that they are updating the sub-watershed study north of Steeles Avenue. SA indicated that it should be okay as long as the flow is the same as the latest study. MTO to discuss offline the approach to this matter.
 - ix) AECOM said that we should know the timeline of the updated study and make sure that we use the most updated model. AECOM will send to CH the flows being used and CH to confirm if we are using the correct flows.
 - x) JK (AECOM) asked the contractual obligation if we use the WCC model. CH indicated that this can be discussed offline.
- b) Steels Avenue Crossing (SM_EL_SM_1_WC2.2) – The crossing will be relocated and upsized to accommodate future flow. This crossing is a design challenge due to cover constraint, low elevation at Steeles Avenue, requiring the crossing to be a longer span (8.5m x 0.90m hydraulic opening) in comparison with the upstream culvert.
 - i) CH indicated that there is new information upstream of Steeles Avenue. Upstream of SM_EL_SM_1_WC2.1 as potential wetland.
 - ii) EG (AECOM-ENV) stated that AECOM will investigate compensating wetland loss.
 - iii) CH would like to understand the timeline. EG said that filed investigation was done in 2020 and updated in 2022, Memo will be submitted soon.
 - iv) MTO will also require development upstream that they are not impacting highway crossings.
- c) Wetland Hazard and Pond 1 Relocation – Realignment of Highway 401 and 407 ETR ramp will impact almost one-half of the existing wetland hazard. This is a non-PSW wetland with a drainage area of ±3.6 ha. Approximately 2.1 ha drainage will be diverted to accommodate Pond 1 relocation. Compensation will be provided for wetland loss.
- d) Pond 6 Relocation – Two locations are being considered. The pond will also accommodate future flows and control flows to predevelopment condition. Design challenge, however, is that there is no existing information for this pond. AECOM assumed that this pond is only providing quality control and rating curve is based on existing surface.
 - i) CH indicated that they would look into existing information for Pond 6.
- e) Pond 3 Relocation and Modification - Ramp realignment will impact existing pond and 2 crossings. This is a grading challenge. AECOM is in the process of confirming if available area is sufficient.
- 8) BR discussed consultation, review process, summary, and other concerns:
 - a) CH is concerned with more culverts and wetlands. Updated information will be provided in January- February.
 - b) Design in 2022 is currently at 30%, in 2023 will be at 60%
 - c) No reporting has been done yet but requires feedback from CH. CH requested the PowerPoint presentation so that they can provide feed back.
 - d) AECOM will send flow used for Sixteen Mile Creek Culvert.
 - e) Other concerns:
 - i) Jacek Strakowski (JS) of CH expressed concerned with groundwater, significant recharge areas, and requested that all SWM pond will require liner.
 - ii) AECOM states that we are not yet into that level of detail but will be considered on the detail design.

Ref	Action	Responsible	Due by	Initial
01	Provide updated information (environmental and drainage/models) to AECOM	Conservation Halton		
02	Provide flow used in Sixteen Mile Creek HEC-RAS Model for CH confirmation that updated flows are used.	AECOM

Minutes

Meeting name Drainage consultation meeting with Credit Valley Conservation, CVC, Consultants and MTO	Meeting date Dec 10, 2020	Attendees Jakub Kilis, CVC Rizwan Haq, CVC Lukasz Grobel, MTO Shahbaz Asif, MTO Felipe Sapaterio, AECOM Brian Richert, AECOM Rhonneke Van Riezen, AECOM Jenny Dai, AECOM
Time 9:00am	Location MS Teams	
Project name GTA West GWP 13 20001 Assignment Number 2013-E-0008	AECOM project number 60347240	
Prepared by B. Richert/J.Dai		

- 1) Brian Richert introduced project team and gave an overview of the project history, status and schedule, including:
 - a) Stage 2 of GTAWest Study started in 2014 and was suspended in December 2015. On June 19, 2019, the government announced that the GTA West Study will resume from its point of suspension in 2015.
 - b) Assessing and evaluating the shortlist of route alternatives have been completed and the preferred route and interchange locations were selected. Currently the design team is developing the preferred plan to a preliminary design level.
 - c) The new corridor is anticipated to be a 4 to 6-lane highway with a separate adjacent transitway. The highway corridor has a capacity for widening to 10 lanes ultimately.
- 2) Brian Richert gave an overview of study area and drainage features within limits of CVC and drainage scope, including
 - a) GTAWest corridor crosses three conservation authorities – Conservation Halton (CH), Credit Valley Conservation (CVC) and Toronto Region Conservation Authority (TRCA).
 - b) The preferred GTAW route intersects four sub-watersheds in CVC's jurisdiction – Mullet Creek, Levi Creek, Credit River, and Huttonville Creek.
 - c) Within CVC's jurisdiction, the preferred GTAW route extends approximately 12 km and new three interchanges are proposed – Winston Churchill Boulevard Interchange, Bovaird Drive Interchange, Mayfield Road Interchange.
 - d) Primary tasks of drainage work include but not limited to watercourse crossing design, stormwater management, and possible creek realignment. A major bridge crossing over Credit River will be designed.
 - e) Interchange drainage is an important feature. Channel realignment might be required at interchanges. Creek realignment has been considered as one of evaluation factors during the route section exercise.
- 3) Specific issues and design criteria discussion:
 - a) Mullet Creek Subwatershed: The study area crosses headwater of Mullet Creek. A numbers of minor watercourse crossings are required to remain existing drainage pattern.
 - b) Levi Creek Subwatershed: Minor creek realignment might be required for the tributaries of Levi Creek at/adjacent to the new Winston Churchill Boulevard Interchange.
 - c) Credit River Bridge Crossing:
 - i. Rhonneke indicates that 100-year erosion rate is determined based historical air photo review. The calculated 100-year erosion rate is approximately 20 m. The proposed piers will be located outside of 100-year erosion limits.
 - ii. Generally, CVC is looking for technical supporting documents for review. CVC indicated that Design team should follow relevant technical guidelines including CVC Technical Guidelines for

Watercourse Crossings and TRCA's Meander Belt Delineation. Meander belt width is recommended to be provided as part of the technical supporting document.

- iii. AECOM will provide a Technical Memo of Fluvial Geomorphology Assessment of Credit River to CVC for a review. Any drainage / fluvial submissions could be sent to Jakub Kilis (CVC) upon approval from MTO.
 - iv. Design Team noted that preliminary assessment based on CVC's HEC-RAS model (Stantec 2008) shows the proposed crossing will cause a minor increase on upstream Regulatory Flood Level (<5 cm) due to piers within floodplain. Design Team will provide technical document of hydraulics assessment for CVC review.
 - v. CVC indicated that there are no significant hydrology/hydraulics updates on Credit River recently. However, CVC will provide the up-to-date hydraulic model to the Design Team through data request.
- d) Tributaries of Credit River and Hutonville Creek Subwatershed (GTAWest corridor from Bovaird Drive Interchange to Mayfield Road Interchange).
- i. At many locations, the creek alignments overlap with GTAWest roadway platform and the footprint of new interchanges, certain level of creek realignments of Credit Creek tributaries and tributaries of Hutonville Creek might not be avoided. Design Team will further evaluate the potential impact and mitigation measures.
 - ii. Jakub Kilis pointed out that the City of Brampton is working on the Secondary Plan for Heritage Heights Community (stretching from Mayfield Road to the Credit River valley, and from Winston Churchill Boulevard to Mississauga Road). The development of Heritage Heights will change drainage nature of this area. Felipe Sapaterio indicated that Design Team had a meeting with the City and will continue to work with the City to integrate GTAWest design with Secondary Plan of Heritage Heights.
- e) CVC is not expecting a lot of efforts on water balance for the roadway expansion work. However, erosion control is more critical for CVC. The erosion threshold should be determined by fluvial geomorphologic investigation at a reach by reach basis. Heritage Heights Sub-watershed Study has already characterized the natural heritages and established water balance and erosion control criteria which could be referred by Design Team.
- f) Design Team will review source water protection documents which are published in CTC's website. For specific questions regarding source water protection, Design Team could contact Janet Ivey directly in CVC.

4) Data availability and request:

- a) The project team will proceed the data request process.
- b) Sub-watershed Characterization for Heritage Heights by Wood has been completed. The information available at the City's website could be used for GTAWest EA and Preliminary Study.
- c) CVC could provide the latest hydrologic / hydraulic models and floodplain maps. However, CVC doesn't own soil maps.
- d) Regarding applicable fluvial geomorphology reports, CVC could search up in their records if Design Team could highlight locations of interest.

5) Schedule and Consultation Protocol with CVC

- a) Draft drainage deliverables will be completed in summer/fall next year.
- b) The project team will set consultation meeting(s) shortly to establish design criteria and review key issues. Then another meeting might be required for conceptual design review.

Meeting name Hwy 413 - Consultation meeting with CVC	Subject Discussing the preliminary design with CVC	Attendees Brian Richert, AECOM Javeed Khan, AECOM Emily Cameron, AECOM Felipe Sapateiro, AECOM Tim Soroichinsky, AECOM Rhonneke Van Riezen, AECOM Gary Epp, AECOM Jakub Kilis, CVC Rizwan Haq, CVC Christine Wilson, CVC Hossein Hosseini, MTO Shahbaz Asif, MTO Curtis Beyer, MTO Jonathan McGarry, MTO Aamir Munir, WSP Jenny Enoae, WSP Josh Tong, WSP	Regrets Dragan Ilic, AECOM Jay Goldberg, WSP Mark Gimpoli, WSP Saif Ahmad, WSP Christa Beard, WSP
Meeting date December 12, 2022	Time 11:00		
Location Teams	Project name GTA West		
Project number 60315006	Prepared by E. Cameron		

Ref	Discussion / Action	Responsible	Due by
01	Introductions	INFO	
02	Safety moment – snow shovelling	INFO	
03	Agenda Overview	INFO	
04	Background Review	INFO	
05	Fish habitat summary – maps show where all direct or indirect fish habitat exists across the study area	INFO	
06	Channel realignment summary – there are a few watercourse realignments across the site, the most significant of which is at the Bovaird Dr. intersection	INFO	
07	The Heritage heights future development will be completed independent from the Highway design, but AECOM has been in communication with City of Brampton about it.	INFO	
08	Culvert sizing methodology & design criteria – Meet MTO design criteria (1m freeboard, no flooding impacts upstream, No overtopping), CVC Criteria (No increase in Regulatory flood upstream of ROW for regulated watercourses, or a maximum of 0.3m where increase is unavoidable). Regulated watercourse flows are based on HEC-RAS models plus additional for climate change, whereas flows at smaller crossings are determined based on Rational method or United Ontario Flow Method (UOFM) with OFAT flows as a reference.	INFO	
09	Other sizing considerations – Fluvial geomorphology and environment	INFO	
10	There are three main crossings within CVC jurisdiction – Credit River bridge (605m), Levi Creek north of Embleton (65m – 140m), south tributary of Levi Creek downstream of Winston Churchill (12m).	INFO	
11	Credit River Crossing – pier placement & 100yr erosion limit. Piers near watercourse – what are the chances of the watercourse shifting towards piers? How many years before that could occur? CVC is looking for pier locations designed so that if the watercourse comes in contact, the infrastructure is not threatened. The foundation may need to be deeper in these locations	CVC & Structural AECOM	

Ref	Discussion / Action	Responsible	Due by
	(deeper than scour depth). CVC will get back to us. Can we increase span of one set of piers at watercourse? Yes, that's a possible alternative, but more expensive. Should have a separate meeting about this with structural (Dragan). MECP has expectations for the project where environmental aspects may be a higher priority than cost – discussed in TRCA meeting last week. We need to think long term and have a thorough evaluation of alternatives. CVC will ask their geomorphologist to review the design and will complete a risk assessment and provide comments. More discussions will need to occur.		
12	Levi Crossing north of Embleton with redside dace criteria (30m offset + meander belt = 140m span). Different alternatives could minimize span. Could realign small section upstream to reduce span. Different pier configurations could minimize impacts. CVC can't comment on MECP regulations, however, it is CVC's preference not to alter the channel and to span the 100yr erosion rate of the watercourse. There is a private online pond connected upstream of proposed structure which impacts water levels, and realignment could include the removal of that connection – will need to discuss more in the future with all parties. Along Levi Creek we are more than spanning the wetlands, but more pier placement assessments could to minimize impacts.	All parties to discuss later	
13	Wetland impacts at Credit River crossing – constructability and short- and long-term impacts. The final pier configuration will account for this. We will mitigate impacts as much as possible and find optimal design and look for opportunities for enhancement if possible. MTO understands that criteria must be met and all factors be considered.	INFO	
14	AECOM will provide proposed drainage mosaic to CVC for review, showing culvert locations, ditch locations, ponds, watercourse realignments.	AECOM	
15	Next steps – what does CVC want to see? 30% design now, 60% next summer. What deliverables will AECOM have and in what format? TRCA wants all models, spreadsheets, all background files loaded on Sharepoint. CVC wants technical information, similar to TRCA. AECOM to provide folder template used for TRCA for CVC to review. Site-specific decision-making rationale should be included.	AECOM	ASAP
16	Ecology impacts – has this been reviewed? Environmental has input on potential impacts affected by span requirements. Ecological assessment of crossings will be part of impact assessment and will be submitted with the deliverables package.	INFO	
17	Check Levi Creek HEC-RAS flows – separate discussion between AECOM and CVC to confirm flows.	AECOM & CVC	ASAP
18	CVC recommends a 15% increase to flows to consider climate change. AECOM has assumed a 10% increase– AECOM and CVC will discuss.	AECOM & CVC	
19	If AECOM has any other questions / clarifications for CVC pass them along and meetings can be set up to discuss.	INFO	

Minutes

Meeting name Drainage consultation meeting with Toronto Region Conservation Authority, TRCA, Consultants and MTO	Meeting date October 06, 2020	Attendees Sharon Lingertat, TRCA Dan Hipple, TRCA Maria Parish TRCA Dilnesaw Chekol, TRCA Lukasz Grobel, MTO Shahbaz Asif, MTO Heather Templeton, WSP Jay Goldberg, WSP Brent Gotts, WSP Madhav Baral, WSP Tim Sorochinsky, AECOM Brian Richert, AECOM Rhonneke Van Riezen, AECOM Jenny Dai, AECOM
Time 9:00am	Location MS Teams	
Project name GTA West GWP 13 20001 Assignment Number 2013-E-0008	AECOM project number 60347240	
Prepared by B. Richert/J.Dai		

- 1) Brian Richert introduced project team and gave an overview of the project history, status and schedule, including:
 - a) Stage 2 of GTA West Study started in 2014 and was suspended in December 2015. On June 19, 2019, the government announced that the GTA West Study will resume from its point of suspension in 2015.
 - b) Assessing and evaluating the shortlist of route alternatives have been completed and the preferred route and interchange locations were selected. Currently the design team is developing the preferred plan to a preliminary design level.
 - c) The new corridor is anticipated to be a 4 to 6-lane highway with a separate adjacent transitway. The highway corridor has a capacity for widening to 10 lanes ultimately.
- 2) Brian Richert gave an overview of study area and drainage features within limits of TRCA and drainage scope, including
 - a) GTA West corridor crosses three conservation authorities and majority of study area is within TRCA jurisdiction.
 - b) The preferred GTA West route crosses headwater of Etobicoke Creek watershed and West Humber River Watershed with numerous small tributaries.
 - c) It is anticipated that several large crossings will be required, including crossings at West Humber River, Main Humber River and East Humber River.
 - d) Many new interchanges are proposed along the corridor including three freeway to freeway interchanges within TRCA jurisdiction (Highway 410 Interchange in West Humber watershed, Highway 427 Interchange in Main Humber watershed and Highway 400 Interchange in East Humber watershed).
 - e) Interchange drainage is an important feature. Channel realignment might be required at interchanges.
 - f) Primary tasks of drainage work include watercourse crossing design, stormwater management, and possible creek realignment.
- 3) Rhonneke Van Riezen indicated that the fluvial geomorphology team has completed field works to assess intermittent and permanent watercourses. Fluvial team will provide crossing size recommendations based TRCA guidelines, historical air photos, empirical equations and a high-level hydraulics analysis using HECRAS. In addition, meander belt and erosion rate assessment and preliminary inputs on watercourse realignment will be carried out. Maria Parish recommended that headwater drainage feature assessment should be carried out by using TRCA's headwater drainage feature assessment tool. The specific scope for headwater assessments will be discussed in a subsequent meeting with TRCA.

4) Key issues and design criteria discussion:

- a) Sharon Lingertat indicated that TRCA is looking for a formal response from project team to TRCA's recommendation letter in January. Heather Templeton will follow up with consultation team regarding the status.
- b) Maria Parish and Dan Hipple outlined general requirements from ecological and water resources perspectives, including:
 - i. Generally, the channel realignment is not supported by TRCA. If a channel realignment has to be proposed, the design team has to justify that there are no other reasonable alternatives.
 - ii. TRCA is looking for LID measures for infiltration and feeding the groundwater system.
 - iii. Feature-based water balance is required for wetlands (not only provincial significant wetland), where 4% of drainage area of the wetland is to be altered. Feature-based water balance guideline from TRCA should be followed for this evaluation. Three-year baseline data collection is required.
 - iv. For the feature-based water balance to the wetland, continuous simulation modelling is also required, which will include the storage function of the wetland and potentially a groundwater component (depending on the wetland characteristics).
 - v. Identification of wetland depends on project team 's evaluation. ELC mapping could be used as a basis.
 - vi. Valley crossing and stream crossing requirements have been provided in TRCA recommendation letter.
 - vii. Erosion sediment control should comply to TRCA's the most up-to-date Erosion Sediment Control guideline. TRCA will be expecting more attention to ESC than was provided in recent examples of 400-series highway construction.
 - viii. Normally salt and oil could not be treated efficiently by the stormwater management ponds. TRCA is looking for no impairment to the nature system including mitigation measures to the impact from salt and oil.
 - ix. Erosion control requires minimum 5 mm on-site retention. Ditching system of Highway would be a great opportunity for incorporating LID features. There was some discussion identifying the possible use of underground storage/infiltration systems in the ROW.
 - x. Stormwater management should be designed for ultimate condition (i.e. 10 lanes with closed median).
 - xi. As for quantity control, the release unit rate defined in TRCA SWM criteria should be achieved.
 - xii. For the watercourse crossings design, TRCA is looking for zero impact on the Regulatory water level beyond MTO right-of-way.
 - xiii. Preferably, the proposed crossing should span over 100 year erosion limits.
 - xiv. The SWM system should be designed for the ultimate 10-lane closed median condition.
 - xv. All drainage features should be identified / confirmed during field investigations, as some minor watercourses may not be in the TRCA database.
- c) Shahbaz Asif noted that linear feature of BMPs such as grass swale with permanent structures could be considered for water quality/quantity, especially for small drainage areas (less 5 ha).
- d) Dan Hipple indicated that climate change has not been included into TRCA's current watershed hydrologic model. TRCA's major concern is the Regional storm. However, the parameters in TRCA hydrologic models could used together with MTO's IDF curves with climate change considerations for peak flow estimation of return period storms.

5) Data availability and request:

- a) TRCA provided available data list and data share agreement last week. The project team will proceed the data request process.
- b) Design Team will follow up with TRCA regarding digital file of catchment discretization, technical reports of hydrology and hydraulics study and other required data if any.

6) Schedule and Consultation Protocol with TRCA

- a) Draft drainage deliverables will be completed in summer/fall next year.
- b) The project team will set consultation meeting(s) shortly to establish design criteria and review key issues. Then another meeting will be required for conceptual design review, early in the process.
- c) The drainage team will send a draft meeting list and proposed time frames after this meeting.

Ref	Action	Responsible	Due by	Initial

Minutes

Meeting name Drainage consultation meeting with Toronto Region Conservation Authority, TRCA, Consultants and MTO	Meeting date March 04, 2021	Attendees Dan Hipple, TRCA Maria Parish, TRCA Dilnesaw Chekol, TRCA Suzanne Bevan, TRCA Trina Seguin, TRCA Adam Dembe, TRCA Ali Shrazi, TRCA Harsimrat Pruthi, TRCA Jim Dowell, WSP Keith Cherneski, MTO Jenny Enoae, WSP Gary Epp, AECOM Shahbaz Asif, MTO Madhav Baral, WSP Brian Richert, AECOM Rhonneke Van Riezen, AECOM Jenny Dai, AECOM
Time 2:00pm	Location MS Teams	
Project name GTA West GWP 13 20001 Assignment Number 2013-E-0008	AECOM project number 60347240	
Prepared by B. Richert/J.Dai		

- 1) Agenda and Purposes of the Meeting: Attendees introduced themselves. Brian Richert reviewed agenda and purposes of this meeting, including
 - a) Reviewing of data/ modeling received;
 - b) Confirming design criteria regarding design storms and climate change consideration;
 - c) Giving some examples of stream realignment and get a sense of TRCA feedback; and
 - d) Confirming scope of wetland impact and headwater evaluations
- 2) Review the received information from TRCA:
 - a) Design Team presented findings of comparison among available topography data sources (MNRF LiDAR, MTO DTM within Corridor and TRCA 0.5m contours) and indicated that there is a better agreement between MTO DEM and TRCA 0.5 m contours. Design Team will use TRCA catchment delineation for the external drainage area and use MTO DEM for catchment delineation within MTO corridor.
 - b) The 'estimated' Hydraulic Models provided by TRCA has no structures, no defined top of bank and only one flow value. Dilnesaw Chekol (TRCA) also noted that the 'estimated' Hydraulic Models are based with coarse resolution topographic information and out-dated flows. Design Team will update TRCA 'estimated' model close to Highway crossings and also extend downstream reasonably to set up boundary condition.
 - c) Floodplain map of East Humber at Highway 400 Crossing is missing. Design Team will further request the missing information from TRCA.
- 3) Design Criteria – Design Storm and Climate Change.
 - a) Design Team indicated that MTO IDF (2021) produces $\pm 15\%$ higher rainfall depth than the design storms used in TRCA's watershed hydrology models and climate change (based on comparison of MTO 2096 IDF and 2021 IDF) will introduce another $\pm 15\%$ increase on total rainfall depth.
 - b) TRCA agreed that the design storm selection for watercourse crossing sizing could be based on MTO guidelines; For the stormwater management design, longer duration of design storms (at least 12-hour duration) should be used to determine storage requirement.
 - c) Shahbaz Asif recommended to have an off-line discussion within design team for design storm selection of this project.

4) Examples of Stream Realignment and TRCA's Feedbacks

a) Example 1: Airport Road Interchange (Salt Creek)

- i. Design Team reviewed background information of Salt Creek at Airport Road Interchange, and preliminary concepts of channel realignment and its benefits, including
 - o Salt Creek Main Channel and Tributary 4 cross GTA West/Airport Interchange at 12 locations
 - o Watercourse at the junction falls under "Contributing to Redside Dace Recovery Habitat".
 - o Tributary 4 is intermittent, warm water regime at u/s of junction. Main Channel from junction to Airport Road crossing north of corridor is permanent warm water
 - o Approximate drainage area of watercourse at junction is about 12 km², falls under the small watercourse per TRCA guideline
 - o The benefits of channel realignment include reducing number of crossings, reducing the number of enclosures, creating habitat more favourable to Redside Dace, easier implementation of SWM, etc.
- ii. TRCA recommendations:
 - o Maria Parish (TRCA) recommended that Design Team to provide supporting contours and grading limits, other natural heritages impacts such as wetland and tree removal. It would be beneficial to overlap channel realignment with air photos.
 - o Ali Shrazi (TRCA) pointed out that the potential engineering solutions for slope stability might be considered for the situation where significant grading is anticipated.
 - o Dan Hipple flagged out that Design Team should demonstrate the floodplain impact to adjacent properties and the level of property acquisition.

b) Example 2: Highway 427 Interchange – Robinson Creek Tributary 4

- i. Design Team reviewed the background information and preliminary concept of channel realignment, including
 - o Robinson Creek Tributary 4, running along the S-E/W connecting ramp of Highway 427 to GTA West, is required for realignment during a conflict with the future ramp;
 - o The ramp design has been optimized by considering many factors;
 - o The watercourse is intermittent and indirect fish habitat; and
 - o Main realignment portion is situated within agriculture land
- ii. TRCA recommendations:
 - o Maria Parish (TRCA) recommended that Design Team to provide grading impacts and natural feature impacts and present realignment options with air photos;
 - o Dan Hipple (TRCA) indicated that TRCA is looking for evaluation of floodplain impacts and also details of fluvial geomorphology.

c) Example 3: Highway 27 Interchange – East Humber Tributary 1_6 (Lower East Reaches)

- i. East Humber Tributary 1_6 conflicts with the future westbound lanes of GTAWest. Channel realignment is required; Design Team presented four options (preliminary concepts).
- ii. TRCA recommendations:
 - o Ali Shrazi pointed out that re-grading through the valley might trigger geotechnical issue.
 - o Options of "Enclosure" and "Bridge structures" spanning over the valley could be considered. TRCA suggested that Design Team to list all the possible options and a table of Cons/Pros of options could be helpful.

d) Example 4: Chinguacousy Interchange - Etobicoke Creek West Branch:

- i. Design Team reviewed background information and potential consolidation tributaries, including
 - o 5 tributaries of Etobicoke Creek West Branch (Intermittent Warm watercourse with indirect Fish Habitat) are intersecting the new interchange and its ramps

- o These tributaries are contributing PSWs with contributing catchments ranging from 42 ha to 345 ha.
 - o There is no mapped Regulatory floodline in this area
 - o Consolidation of tributaries could reduce numbers of crossings and provide more flexibility on implementation of stormwater management.
 - ii. TRCA Recommendations:
 - o Generally, TRCA doesn't support consolidating tributaries for the situation like this.
 - o Maria Parish (TRCA) noted that consolidating tributaries will cause erosion and impacts to natural habits on the downstream reaches.
 - o Feature-based water balance for wetland and continuous simulation for erosion assessment might be required due to consolidation of tributaries.
 - o Dan Hipple (TRCA) suggested the Design Team to use Wetland Risk Evaluation Tool to classify the risks. Wetland Risk Evaluation could provide guidance on feasibility of channel realignment and SWM discharges.
- e) Example 5: Mayfield /Highway 410 Interchange - Etobicoke Creek:
 - i. Design Team presented the background information and the needs of channel realignment, including
 - o New Highway 410 ramp is proposing to underpass the Highway 410 expansion and Mayfield Road.
 - o Channel realignment is required to accommodate the proposed geometry of Highway 410 ramp;
 - o Wetland (PSW) encroachment is anticipated.
 - o Channel realignment could provide opportunity to commentate the habit loss.
 - ii. TRCA Recommendation:
 - o TRCA recommended that design team to further confirm the entire drainage system function;
 - o TRCA recommended that design team to characterize wetland feature (groundwater feeding or surface water feeding) and confirm the water level at the wetland.
- f) Design Team presented other examples with potential tributary consolidation and channel realignment, including
 - o West Humber Tributary 1 between Airport Road and Innis Lake Road
 - o Rainbow Creek Tributary 1 at Coleraine Drive
 - o Robinson Creek Tributary Highway 50: Four branches of Robinson Creek

TRCA indicated that generally following evaluations are required to support channel realignment:

 - o Quantifying stream losing;
 - o Evaluating erosion risk at reach basis if any consolidation and channel realignment cause flow changes to the stream beyond MTO ROW
 - o Evaluating grading impacts
 - o Providing low flow channel design
- 5) Major Crossings at Humber River Main Channel and East Branch.
 - a) Brian Richert indicated that the bridge will span the valley, although it is too early to show details. Slope stability factor will be considered from the 100-year erosion limit to avoid slope failure while determining the span, and 100-year erosion limits to determine pier locations.
 - b) Rhonneke indicated that 100-year erosion rate is estimated based on historical air photos by following TRCA's Crossing Guideline.
 - c) TRCA pointed out that slope stability should be assessed, and meander belt width should be evaluated for major watercourse crossings.

- 6) Scope of wetland impact and headwater evaluations
 - a) TRCA indicated that Design Team should use Risk Evaluation tool to evaluate all the wetlands (not only PSWs).
 - b) MTO should follow TRCA's Compensation Protocol for any wetland loss.
 - c) For the headwater evaluation, Maria Parish (TRCA) noted that Design Team needs to follow Evaluation, Classification and Management of Headwater Drainage Features Guidelines to identify scope.
- 7) Borehole within TRCA's Regulatory Area:

Bevan Suzanne indicated that TRCA could provide clearance for borehole screening. Design Team should provide information including vegetation removal, soil disturbance, access and depth of borehole, etc.

Meeting name Drainage consultation meeting with Conservation Halton, Conservation Halton, Consultants and MTO	Meeting date September 30, 2020	Attendees Leah Smith, CH Charles Priddle, CH Yelena Koshenkov, CH Yves Scholten, CH Jacek Strakowski, CH Shahbaz Asif, CH Brian Richert, AECOM Jenny Dai, AECOM Rhonneke Van Riezen, AECOM Felipe Sapaterio, AECOM
Time 9:00am	Location MS Teams	
Project name GTA West GWP 13 20001 Assignment Number 2013-E-0008	AECOM project number 60347240	
Prepared by B. Richert/J.Dai		

- 1) Brian Richert introduced project team and attendees introduced themselves; The PowerPoint presentation is attached to these minutes.
- 2) Brian Richert gave an overview of the project history, status and schedule, including
 - a) Stage 2 of GTAWest Study started in 2014 and was suspended in December 2015. On June 19, 2019, the government announced that the GTA West Study will resume from its point of suspension in 2015.
 - b) Assessing and evaluating the shortlist of route alternatives have been completed and the preferred route and interchange locations were selected. Currently the design team is developing the preferred plan to a preliminary design level.
 - c) The new corridor is anticipated to be a 4 to 6-lane highway with a separate adjacent transitway.
- 3) Brian Richert gave an overview of study area and drainage features within limits of Conservation Halton (vicinity of the 401/407ETR IC), including
 - a) Major existing drainage features associated with GTAW within Conservation Halton jurisdiction consists of one major watercourse (East Sixteen Mile Creek), several tributaries of East Branch Lisgar and six stormwater management ponds within 401/407ETR interchange;
 - b) Reconfiguration of 401/407ETR interchange is being proposed to provide freeway to freeway connection for GTAW corridor to Highway 401 and Highway 407;
 - c) New water crossings at the 401/407ETR within the limits of the interchange and impacts/modifications to the SWM ponds likely are required. Further extension of the Sixteen Mile Creek /Highway 401 culvert east of Trafalgar Interchange is likely required.
 - d) Highway 401 West Expansion (a separate MTO project) within the study area is under design and construction stage.
- 4) Data availability and request:
 - a) Jenny Dai indicated project team has received hydrology/hydraulics models and GIS layers from CH in 2014. Project team also downloaded open data recently from Conservation Halton's website.
 - b) Yelena Koshenkov suggested to request a new set of models to ensure design team using the up to date information.
 - c) More detailed GIS information could be provided through data request.
 - d) Yelena Koshenkov noted an ongoing Ninth Line Watershed study with City of Mississauga might be ready by the end of this year. The study includes hydrology/hydraulics analysis of Lisgar tributaries. This study covers the south of 401 but may not include the watercourses within the 401/407ETR interchanges.

- e) Yelena Koshenkov noted watershed study for Steeles Ave W (Premier Gateway Phase 2B) has started. The study includes information on future development along Steeles Ave. However the report and associated hydrology/hydraulic models have not been completed. GTAW project team needs to request this information through municipalities.
- f) Shahbaz Asif noted, based on the schedule of GTAW, the models associated with above two municipal studies may not be finished/included in time.
- g) Jacek Strakowski noted that Source Protection Report developed in 2014 should be helpful for the project team and could be provided by Conservation Halton.

5) Schedule and Consultation Protocol with Conservation Halton

- a) Draft drainage deliverables will be completed at least by the end of next year;
- b) The project team would like to have consultation meetings with Conservation Halton at key milestones;
- c) The project team will set an early consultation meeting to establish design criteria and review key issues.
- d) Other meetings could be set up once reaching to certain design levels (such as 60%).

BY E-MAIL ONLY (brian.richert@aecom.com)

To Brian Richert:

**Re: Draft Drainage and Stormwater Management Report – West Section Conservation Halton Area
Highway 413 Transportation Corridor Route Planning, Preliminary Design and Environmental Assessment
CH File Number(s): APPR-30**

Thank you for the opportunity to review and comment on the *Draft Drainage and Stormwater Management Report – West Section Conservation Halton Area*, prepared by AECOM and WSP dated September 2023. Conservation Halton (CH) staff acknowledge that Provincial Ministries are not bound by the *Conservation Authorities Act* and are not required to obtain CH permits. Therefore, CH staff has reviewed the report to provide recommendations based on our regulatory review expertise for development proposed in natural hazards and to comment on the risks related to natural hazards.

Proposal

The *Draft Drainage and Stormwater Management Report – West Section Conservation Halton Area* documents the drainage and stormwater management assessment for the proposed improvements at the west limit of the Highway 413 Transportation Corridor Route Planning, Preliminary Design and Environmental Assessment project including the proposed interchange with Highway 401 and Highway 407 within the West Section of the project area.

Background

CH previously provided comments (letter dated August 3, 2023) on the *Initial Project Description* which can be referred to for further background information.

Key Comment

The proposed extension of the Sixteen Mile Creek culvert under Highway 401 (Culvert SM_EB_SIM_0_WC1) shows a 0.15 metre increase in the upstream Regional Flood level. The increase may be due to storage losses as a result of a bend in the culvert's design to align with the downstream watercourse reach. CH staff suggest investigating whether straightening the bend in the culvert's design and realigning the downstream watercourse reach to meet the new outlet location would mitigate the upstream increase.

Recommendation

CH staff recommend that the above-referenced culvert design be investigated further to mitigate any potential upstream increase and would be pleased to meet with the consultant team to discuss further.

We trust the above is of assistance. Please contact the undersigned with any questions.

Sincerely,

Ola Panczyk
Senior Environmental Planner

Response to December 19, 2023 Conservation Halton Comments

The proposed increase in the upstream Regional Flood level for the proposed extension of the Sixteen Mile Creek Culvert under Highway 401 (Culvert SM_EB_SIM_0_WC1), as shown in the draft report dated September 2023, reflects a highly conservative estimate. AECOM investigated further the hydraulic loss resulting from the proposed culvert bend by modeling the culvert as a rectangular channel to allow additional cross-section at the bend location. This approach made it possible to input the loss coefficient at the bend in the HEC-RAS and calculate the increase in energy grade (EG) line at the upstream face of the culvert. Assuming a loss coefficient (K) of 0.1 (K for the culvert is only 0.085, 30 deg. bend), the estimated energy loss is 0.02 m. This loss was input in HEC-RAS and will be calculated as an additional EG. Results of the updated analysis indicated that the increase in Regional Flood level was reduced to 0.10 m from the 0.15m that was initially reported. Based on this analysis, straightening the bend in the culvert and realigning the downstream watercourse may not significantly reduce the upstream water level. The increase in the water level is attributed mainly to the culvert extension, and the rise in water level due to the bend is insignificant.

Unit Hyd Qpeak (cms)= 1.015

PEAK FLOW (cms)= 0.260 (1)
TIME TO PEAK (hrs)= 12.067
RUNOFF VOLUME (mm)= 21.534
TOTAL RAINFALL (mm)= 57.689
RUNOFF COEFFICIENT = 0.374

(1) PEAK FLOW DOES NOT INCLUDE BASEFLOW IF ANY.

CALIB
NASWYD (0150)
ID= 1 DT= 2.0 min
Area (ha)= 6.87
Ia (mm)= 5.00
U.H. Tp(hrs)= 0.19
Curve Number (CN)= 82.0
of Linear Res.(N)= 3.00

NOTE: RAINFALL WAS TRANSFORMED TO 2.0 MIN. TIME STEP.
