WSP Statement of Qualifications and Limitations

WSP prepared this report solely for the use of the intended recipient, Ontario Ministry of Transportation, in accordance with the professional services agreement between the parties. The report is intended to be used in its entirety. No excerpts may be taken to be representative of the findings in the assessment.

The conclusions presented in this report are based on work performed by trained, professional and technical staff, in accordance with their reasonable interpretation of current and accepted engineering and scientific practices at the time the work was performed.

The content and opinions contained in the present report are based on the observations and/or information available to WSP at the time of preparation, using investigation techniques and engineering analysis methods consistent with those ordinarily exercised by WSP and other engineering/scientific practitioners working under similar conditions, and subject to the same time, financial and physical constraints applicable to this project.

WSP disclaims any obligation to update this report if, after the date of this report, any conditions appear to differ significantly from those presented in this report; however, WSP reserves the right to amend or supplement this report based on additional information, documentation or evidence.

WSP makes no other representations whatsoever concerning the legal significance of its findings.

The intended recipient is solely responsible for the disclosure of any information contained in this report. If a third party makes use of, relies on, or makes decisions in accordance with this report, said third party is solely responsible for such use, reliance or decisions. WSP does not accept responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken by said third party based on this report.

WSP has provided services to the intended recipient in accordance with the professional services agreement between the parties and in a manner consistent with that degree of care, skill and diligence normally provided by members of the same profession performing the same or comparable services in respect of projects of a similar nature in similar circumstances. It is understood and agreed by WSP and the recipient of this report that WSP provides no warranty, express or implied, of any kind. Without limiting the generality of the foregoing, it is agreed and understood by WSP and the recipient of this report that WSP makes no representation or warranty whatsoever as to the sufficiency of its scope of work for the purpose sought by the recipient of this report.

In preparing this report, WSP has relied in good faith on information provided by others, as noted in the report. WSP has reasonably assumed that the information provided is correct and WSP is not responsible for the accuracy or completeness of such information.

Benchmark and elevations used in this report are primarily to establish relative elevation differences between the specific testing and/or sampling locations and should not be used for other purposes, such as grading, excavating, construction, planning, development, etc.

Design recommendations given in this report are applicable only to the project and areas as described in the text and then only if constructed in accordance with the details stated in this report. The comments made in this report on potential construction issues and possible methods are intended only for the guidance of the designer. The number of testing and/or sampling locations may not be sufficient to determine all the factors that may affect construction methods and costs. We accept no responsibility for any decisions made or actions taken as a result of this report unless we are specifically advised of and participate in such action, in which case our responsibility will be as agreed to at that time.

This limitations statement is considered an integral part of this report.

AECOM Statement of Qualifications and Limitations

The attached report (the “report”) has been prepared by AECOM Canada ULC (“AECOM”) for the benefit of the Client (“Client”) in accordance with the agreement between AECOM and Client, including the scope of work detailed therein (the “Agreement”).

The information, data, recommendations and conclusions contained in the report (collectively, the “Information”):

- is subject to the scope, schedule, and other constraints and limitations in the Agreement and the qualifications contained in the report (the “Limitations”),
- represents AECOM’s professional judgement in light of the Limitations and industry standards for the preparation of similar reports,
- may be based on information provided to AECOM which has not been independently verified,
- has not been updated since the date of issuance of the report and its accuracy is limited to the time period and circumstances in which it was collected, processed, made or issued,
- must be read as a whole and sections thereof should not be read out of such context,
- was prepared for the specific purposes described in the report and the Agreement, and
- in the case of subsurface, environmental or geotechnical conditions, may be based on limited testing and on the assumption that such conditions are uniform and not variable either geographically or over time.

AECOM shall be entitled to rely upon the accuracy and completeness of information that was provided to it and has no obligation to update such information. AECOM accepts no responsibility for any events or circumstances that may have occurred since the date on which the report was prepared and, in the case of subsurface, environmental or geotechnical conditions, is not responsible for any variability in such conditions, geographically or over time.

AECOM agrees that the report represents its professional judgement as described above and that the Information has been prepared for the specific purpose and use described in the report and the Agreement, but AECOM makes no other representations, or any guarantees or warranties whatsoever, whether express or implied, with respect to the Report, the Information or any part thereof.

Without in any way limiting the generality of the foregoing, any estimates or opinions regarding probable construction costs or construction schedule provided by AECOM represent AECOM’s professional judgement in light of its experience and the knowledge and information available to it at the time of preparation. Since AECOM has no control over market or economic conditions, prices for construction labour, equipment or materials or bidding procedures, AECOM, its directors, officers and employees are not able to, nor do they, make any representations, warranties or guarantees whatsoever, whether express or implied, with respect to such estimates or opinions, or their variance from actual construction costs or schedules, and accept no responsibility for any loss or damage arising therefrom or in any way related thereto. Persons relying on such estimates or opinions do so at their own risk.

Except (1) as agreed to in writing by AECOM and Client, (2) as required by-law, or (3) to the extent used by governmental reviewing agencies for the purpose of obtaining permits or approvals, the report and the Information may be used and relied upon only by Client.

AECOM accepts no responsibility, and denies any liability whatsoever, to parties other than Client who may obtain access to the report or the Information for any injury, loss or damage suffered by such parties arising from their use of, reliance upon, or decisions or actions based on the report or any of the Information (“improper use of the report”), except to the extent those parties have obtained the prior written consent of AECOM to use and rely upon the report and the Information. Any injury, loss or damages arising from improper use of the report shall be borne by the party making such use.

This Statement of Qualifications and Limitations is attached to and forms part of the report and any use of the report is subject to the terms hereof.

RWDI Statement of Qualifications and Limitations

This report entitled, Highway 413 Preliminary Design and Assessment of Environmental Impacts (Air Quality Impact Assessment),was prepared by RWDI AIR Inc. (“RWDI”) for the Ontario Ministry of Transportation (“Client”). The findings and conclusions presented in this report have been prepared for the Client and are specific to the project described herein (“Project”). The conclusions and recommendations contained in this report are based on the information available to RWDI when this report was prepared. Because the contents of this report may not reflect the final design of the Project or subsequent changes made after the date of this report, RWDI recommends that it be retained by Client during the final stages of the project to verify that the results and recommendations provided in this report have been correctly interpreted in the final design of the Project.

The conclusions and recommendations contained in this report have also been made for the specific purpose(s) set out herein. Should the Client or any other third party utilize the report and/or implement the conclusions and recommendations contained therein for any other purpose or project without the involvement of RWDI, the Client or such third party assumes any and all risk of any and all consequences arising from such use and RWDI accepts no responsibility for any liability, loss, or damage of any kind suffered by Client or any other third party arising therefrom.

Finally, it is imperative that the Client and/or any party relying on the conclusions and recommendations in this report carefully review the stated assumptions contained herein to understand the different factors which may impact the conclusions and recommendations provided.

Executive Summary

The Ontario Ministry of Transportation has retained WSP Canada Inc. and AECOM Canada ULC in collaboration with various sub-consultant and technical firms to undertake the Highway 413 Preliminary Design and Assessment of Environmental Impacts, hereinafter referred to as “the Project”.

The Project is following the requirements of the *Highway 413 Act*, *2024*.

The focus of this report is on air quality and the objective is to predict air quality impacts as it relates to the project. The Air Quality Impact Assessment generally followed the methodology described in the MTO “Environmental Guide for Assessing and Mitigating the Air Quality Impacts and Greenhouse Gas Emissions of Provincial Transportation Projects” (May 2020) (the “MTO Air Quality Guide”).

The air quality impact assessment was undertaken for four scenarios related to the Project:

- No-Build scenario for the project year 2041.
- Build scenario for the project year 2041.
- No-Build scenario for the project year 2051.
- Build scenario for the project year 2051.

The No-Build scenario represents the existing highways and arterial roads within the study area with no modifications of this existing road network. The No-Build scenario represents future conditions without completion of Highway 413, and in this sense represents existing conditions for the purposes of the Air Quality Impact Assessment. The Build scenario includes existing or realigned arterial roads, the 52-kilometre (km) Highway 413 corridor, a 4 km extension to Highway 410, and a 3 km extension to Highway 427 (both facilitating connections to the Highway 413 corridor), for a total of 59 km of new infrastructure (Figure 1-1). The highway will have 11 interchanges at municipal roads. Both the No-Build and Build scenarios are evaluated at project years 2041 and 2051.

The US EPA’s roadway emissions model, MOVES4, was used for emissions modeling. The US EPA’s dispersion model, AERMOD (version 22112), was used for dispersion modeling. Background concentrations were estimated using air quality monitoring data collected by the Ontario Ministry of Environment, Conservation and Parks (MECP) and Environment and Climate Change Canada (ECCC).

Representative sensitive receptors (e.g. residential dwellings) and critical receptors (e.g. retirement homes, hospitals, childcare centres, schools) within the study area were included with three thousand and thirty-four (3,034) existing and potential future receptors in total. These were chosen using a combination of interactive GIS maps and satellite imagery.

The following key contaminants were assessed in accordance with the MTO Air Quality Guide:

- Particulate Matter less than or equal to 2.5 microns ($PM_{2.5}$)
- Particulate Matter less than or equal to 10 microns (PM_{10})
- Carbon Monoxide (CO)
- Nitrogen Dioxide (NO_2)
- Benzo(a)pyrene
- Acetaldehyde
- Acrolein
- Formaldehyde
- Benzene
- 1,3-Butadiene

Traffic composition was based on future (2041 and 2051) traffic information provided by WSP. The distribution of MOVES4 vehicle types was based on current passenger vehicle registration data in Ontario (Statistics Canada, 2024a) and current MOVES fleet data for commercial trucks (US EPA, 2024). MOVES4 default data were used to represent the percentages of zero-emission electric vehicles (EVs) in the future Ontario fleet.

The project is expected to impact local air contaminant levels at receptors throughout the study area. The maximum predicted cumulative concentrations increase at most receptors within the study area. The largest increases are seen in the middle sections of the Highway 413 corridor which are currently predominantly rural areas.

While model-predicted concentrations are expected to increase, for most contaminants and averaging periods the maximum cumulative concentrations remain below current respective thresholds. Contaminants and averaging periods with modelled cumulative concentrations exceeding AAQC or CAAQS thresholds include 24-hour and annual benzo(a)pyrene, 1-hour NO_2 (CAAQS), 24-hour and annual $PM_{2.5}$, and 24-hour PM_{10}.

For all modelled scenarios, annual and 24-hour average benzo(a)pyrene cumulative concentrations exceed their respective AAQC thresholds. The frequency of exceedance is attributed in part to high ambient background concentrations. Background benzo(a)pyrene concentrations for the 24-hour and annual averaging periods exceed the AAQC on their own. Some receptors show a slight decrease in maximum concentration of benzo(a)pyrene in the Build scenario compared to No-Build, but most receptors experience increased concentrations with the Build scenario. The highest receptor sees maximum modelled benzo(a)pyrene concentrations above both the 24-hour and annual benzo(a)pyrene AAQC thresholds. Potential implications of the incremental increase in contaminant concentrations are considered in the Screening Level Human Health Risk Assessment Report (Intrinsik, 2026).

Exceedances of the 1-hour CAAQS threshold for NO_2 at receptors in the study area for the No-Build scenario are generally confined to the western and eastern ends of the Highway 413 corridor close to the existing Highways 400 and 401. Under the Build scenario, these exceedances increase in frequency and extend throughout the study area.

The location of exceedance of 24-hour PM_{10} threshold follows a similar trend to 1-hour NO_2. It expands from localized areas near Highways 400 and 401 under the No-Build scenario to most of the study area under the Build scenario.

To mitigate air quality impacts to future residential areas, municipalities and development proponents could take measures to ensure reasonable setback distances from roadways. Doing so could reduce the potential health impacts of higher concentrations of contaminants and re-entrained road dust that occur closer to the roadways.

Planting roadside vegetation within the study area can stabilize the soil adjacent to the road, reducing erosion and subsequent deposition of particulates on the road surface. Dense plantings of trees and shrubs can act as windbreaks to reduce wind velocity near the road surface and reduce the dispersion of disturbed road dust.

Continued support and investment at all levels of government for policies, technological innovations, and phased-in regulations for on-road vehicle and engine emissions should encourage evolution of the vehicle fleet in Ontario toward alternative fuels and electrification. This transition is expected to reduce NO_2 and other tailpipe emissions.

Ongoing support and investment in policies and innovations that promote the development of complete communities and transit-oriented communities, as well the local and regional public transportation infrastructure required to support them, could encourage sustainable local economies and equitable opportunities, and potentially improve level of service across the existing transportation network. Improved level of service would potentially reduce congestion and delay and therefore reduce associated local air quality impacts.

1. Introduction

1.1 Project Overview

The Ontario Ministry of Transportation has retained WSP Canada Inc. and AECOM Canada ULC in collaboration with various sub-consultant and technical firms to undertake the Highway 413 Preliminary Design and Assessment of Environmental Impacts, hereinafter referred to as “the Project”.

The Project is following the requirements of the *Highway 413 Act, 2024*.

The Project includes the 52-kilometre Highway 413 Corridor, a 4 kilometre extension to Highway 410, and a 3 kilometre extension to Highway 427 (both facilitating connections to the Highway 413 Corridor), for a total of 59 kilometres of new infrastructure (**Error! R eference source not found.**). The highway will have 11 interchanges at municipal roads. Features such as stormwater management ponds, carpool lots, Commercial Vehicle Inspection Facilities, maintenance facilities and the potential for electric vehicle charging stations have been explored as part of Preliminary Design.

Highway 413 will connect Highway 401 and Highway 407 Express Toll Route in the Regional Municipality of Halton and the Regional Municipality of Peel with Highway 400 in the Regional Municipality of York.

The typical right-of-way will be 170 metres which includes 110 metres for the typical mainline highway and 60 metres for a proposed transitway. A multi-use trail parallel to Highway 413 may be accommodated within the proposed transitway right-of-way. The right-of-way is expanded at interchanges and high fills areas to accommodate ramps to and from the crossing roads, as well as in locations with ancillary highway facilities as mentioned above. The Preliminary Design consists of a typical six-lane cross section (three lanes in each direction) with a grassed median. The right-of-way has been designed to accommodate up to ten-lanes (five lanes in each direction) should future traffic conditions warrant additional capacity. These additional lanes would be provided by widening the highway towards the median.

The proposed transitway will be a separate corridor running alongside the highway, dedicated for public transit, including stations to facilitate passenger access at key locations. The proposed transitway and stations will be subject to a separate future assessment of environmental impacts.

Highway 413 is a 400-series highway, which is a network of controlled-access highways throughout the Province of Ontario. Their primary function is to accommodate through traffic and provide links between urban centres. 400-series highways feature full grade separations (such as bridges) at most intersecting roads and railway lines. Interchanges are provided along the 400-series highways to connect to other highways and municipal roads. These highways have design standards to accommodate high speeds and various collision avoidance and traffic management systems. Highway 413 is proposed to have a posted speed limit of 110 kilometres per hour.

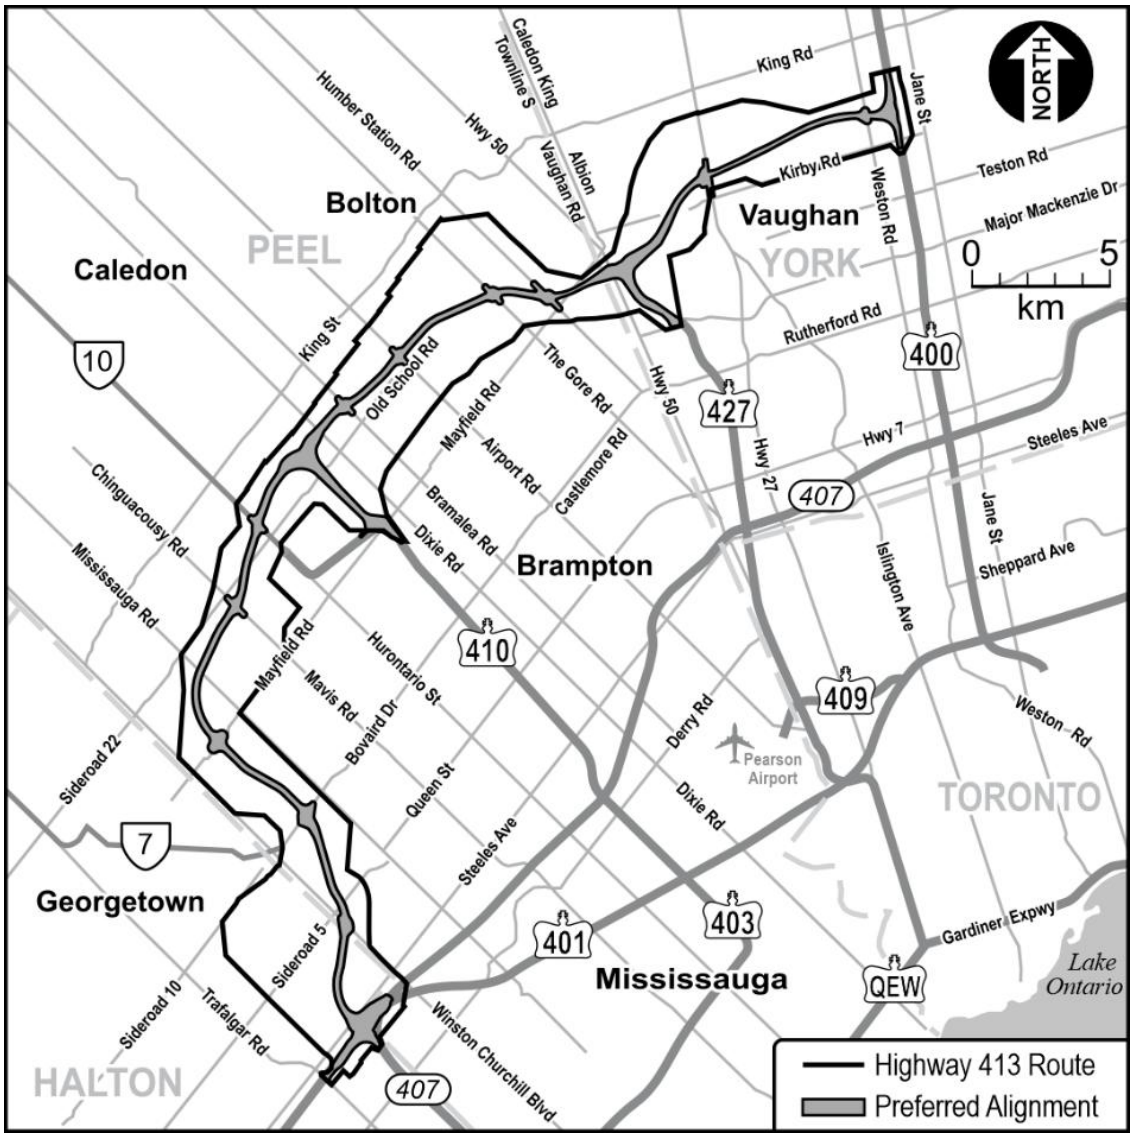

Figure 1-1: Highway 413 Route

The future Highway 413 is expected to:

- Relieve traffic on local roads and parallel highways;
- Help accommodate travel demand;
- Reduce travel times for commuters and goods movement;
- Reduce the social, environmental, and economic costs of congestion;
- Provide greater connectivity between urban growth centres;
- Provide better connections to residential and employment lands; and
- Provide an alternate route in the event of an incident or road closure on local and regional roads.

1.2 Purpose of Report

This report documents the Air Quality Impact Assessment of the Preliminary Design associated with the Highway 413. Readers are encouraged to view this report in its entirety.

1.3 Study Area

The Project includes the 52-kilometre (km) Highway 413 corridor, a 4 km extension to Highway 410, and a 3 km extension to Highway 427 (both facilitating connections to the Highway 413 corridor), for a total of 59 km of new infrastructure (**Figure 1-1**). The highway will have 11 interchanges at municipal roads.

The study area for the Air Quality Impact Assessment includes areas within 500 m on either side of the Preliminary Design ROW, including all new ramps and interchanges as well as the mainline highway. The extent of the study area is shown in a series of figures provided in **Appendix D**.

2. Methodology

2.1 Background Information Review

This assessment generally followed the methodology described in the MTO "Environmental Guide for Assessing and Mitigating the Air Quality Impacts and Greenhouse Gas Emissions of Provincial Transportation Projects" (May 2020) (the "MTO Air Quality Guide").

2.2 Modelled Scenarios

The assessment was undertaken for the following scenarios:

- No-Build scenario for the project year 2041.
- Build scenario for the project year 2041.
- No-Build scenario for the project year 2051.
- Build scenario for the project year 2051.

The No-Build scenario represents the section of Highway 413 within the study area as it currently exists with no modifications of the existing road for the project years 2041 and 2051. The Build scenario includes the 52 km Highway 413 corridor, a 4 km extension to Highway 410, and a 3 km extension to Highway 427 (both facilitating connections to the Highway 413 corridor), for a total of 59 km of new infrastructure. The traffic data used in the No-Build and Build scenarios were based on extensive traffic modelling of future conditions and included morning and evening peak volumes (AM Peak and PM Peak), estimated medium and heavy truck percentages, estimated travel speed, and the Annual Average Daily Traffic (AADT) for every arterial road, highway segment, and ramp within the study area. These traffic parameters were different for each road segment. The details of this traffic data as used in the context of the air quality modelling are provided in **Appendix A**.

2.3 Modelled Roadways

The modelling included all existing and proposed alignments of the 52 km Highway 413 corridor, a 4 km extension to Highway 410, and a 3 km extension to Highway 427 (both facilitating connections to the Highway 413 corridor), and all arterial roads and portions

of Highways 400 and 401 within the study area. The modelled roadway segments for the 2041 and 2051 No-Build scenarios are shown in a series of figures in **Appendix D.2**, and the modelled segments for the 2041 and 2051 Build scenarios are shown in **Appendix D.3**.

2.4 Traffic Data

The traffic data used in the No-Build and Build scenarios were based on extensive traffic modelling of future conditions and included morning and evening peak traffic volumes (AM Peak and PM Peak), estimated medium and heavy truck percentages, estimated travel speed, and the AADT for every arterial road, highway segment, and ramp within the study area. These traffic parameters were different for each road segment.

The travel demand and forecasting used in the analysis included the most direct effects of induced demand as follows:

- Includes users using the new facility to travel to their destinations compared to their original route choice before the facility is built to save travel times;
- Includes users switching to use the new facility that previously used another transportation mode for the trip (e.g., transit-to-auto); and,
- Includes users adjusting their commuting patterns due to the benefits offered by new facility by adjusting the location of their place-of-work and/or place-of-school.

The forecasts do not include the effects of residents changing their place-of-residence caused by the introduction of the new facility.

The details of this traffic data as used in the context of the air quality modelling are provided in **Appendix A**.

To assign the vehicle distribution percentages to appropriate vehicle classes, the MOVES vehicle classification by source type was used (See **Section 2.8** for discussion of MOVES emissions modelling). Percentage breakdown data for truck volumes across all road segments within the study area were adopted under the No-Build and Build scenarios.

The split of passenger vehicles as Passenger Car (MOVES Source Type 21) and Passenger Truck (MOVES Source Type 31) was based on 2023 vehicle registration for Ontario (Statistics Canada 2024b), with this split assumed consistent for future scenarios. The split of Single-Unit and Combination trucks into Short-Haul and Long-Haul was based on MOVES technical guidance (US EPA, 2024).

Hourly profiles were developed to determine diurnal variation of traffic volumes, adapted from United States Environmental Protection Agency (US EPA) guidance (US EPA, 2021). The hourly profiles based on vehicle count and as a percentage of traffic peak volume are provided in **Appendix A.1**. Traffic composition on each roadway segment is provided in **Appendix A.2**. Traffic counts on each roadway segment are provided in **Appendix A.3**. Detailed traffic volumes and an estimate of fugitive particulate emissions are provided in **Appendix A.4**. The raw traffic data for 2041 and 2051 No-Build and Build scenarios can be found in **Appendix A.5**. Traffic profiles and pollutant emission rates were created and reported for each of the four future scenarios (2041 Build/No-Build and 2051 Build/No-Build).

Appendix A1. Hourly Profiles: The traffic volume distribution methodology for this analysis was adapted from the approach in Section 2.2.3 (Refined Analyses of Any Project) of *Using MOVES3 in Project-Level Carbon Monoxide Analyses* to better represent anticipated traffic patterns, particularly during overnight hours. The standard AM peak (6:00–9:00 AM) (A) and PM peak (4:00–7:00 PM) (B) periods were retained, while the treatment of non-peak hours was restructured. A dedicated overnight/late evening period (C) was defined, spanning midnight–6:00 AM and 8:00 PM–midnight (10 hours total), with volumes determined by a specified percentage. This allows flexibility to account for variable nighttime traffic such as freight or shift work. For this assessment, the hourly percentages for the overnight period were estimated based on averaged hourly percentage data from MTO's iCorridor for the sections of Highways 401, 410, 427, and 400 closest to the study area. The remaining off-peak period (D) covers 9:00 AM–4:00 PM and 7:00–8:00 PM, with volumes distributed evenly across those eight hours, and is calculated as follows:

$$\text{Off Peak Period Volume (D)} = \frac{AADT - A - B - C}{8}$$

This refined structure provides greater flexibility when representing the Highway 413 daily traffic profile within the AERMOD component of the air quality model. For the percentage-percentage-basis traffic profiles, the percentages for each hour were expressed as a percentage of the peak hour. These profiles were determined for each roadway segment and used to calculate the emission rates for each contaminant.

Sample calculation for Off-Peak Period Volume for the 2041 Build Scenario and Roadway ID "A01", Hwy 413 N of Hwy 401/407 interchange – NB (A01) at 10 AM (9:00-10:00). The vehicle counts in the following calculations are found in Appendix A.1.1 for hours of day 1-9, 17-19, 21-24.

$$Off - Peak\ Period\ Volume_{A01,10\ AM}$$

$$= \begin{matrix} 59300 - (520 + 346 + 346 + 346 + 520 + 1039 + 3965 + 3965 + 3965) \\ -(4330 + 4330 + 4330) - (1732 + 1516 + 1299 + 866) \end{matrix} /8$$

$$= 3235\ vehicles$$

$$Period\ Percentage_{A01,10\ AM}$$

$$= \frac{3235}{4330} \cdot 100\%$$

$$= 75\%$$

Appendix A2. Traffic Composition: The vehicle compositions for each MOVES vehicle type were derived from the project-specific traffic data and using 2023 vehicle registration data from Statistics Canada (Statistics Canada, 2024b) for passenger vehicles and MOVES technical guidance (US EPA, 2024) for trucks. Vehicle fuel type was based on MOVES4 defaults for vehicle age type distribution and engine type.

Appendix A3. Traffic Counts: The vehicle counts for each roadway section are summarized from the raw traffic data in this section. The values from this section are used to calculate tailpipe emissions as well as the particulate emission rate in **Appendix A.4**.

Appendix A4. Detailed Traffic Data and Fugitive Particulate Matter Emissions: Information is provided for each roadway section, including the ID, direction, peak volumes, and AADT. The project was split into five sections for modeling and the columns "Model Section for Roadway 1 and 2" identify which model section the roadway corresponds to. Roadways that were completely within one model section were given that numeric value (from 1-5) in column "Model Section for Roadway Zone 1". Roadways that were in multiple model sections were assigned values in both "Model Section for Roadway" columns.

Using the peak volumes for AM and PM, the average vehicle weights (by vehicle type), and the roadway speed, base emission rates of $PM_{2.5}$ and PM_{10} were calculated using the mobile emission equation for AP-42 Section 13.2.1 for paved roads:

$$E = k \cdot (sL)^{0.91} \cdot (W)^{1.02}$$

Where:

- E = particulate emission factor (g/VKT)
- k = particle size multiplier
    - $PM_{2.5}$ = 0.15 g/VKT
    - PM_{10} = 0.62 g/VKT
- sL = road surface silt loading (g/m²)
- W = average weight of vehicles traveling the road (US short tons)

The weighted average vehicle weight was determined for AM and PM peaks for each road segment as follows:

$$Weighted\ Average\ Vehicle\ Weight$$

$$= \frac{\sum_{MOVES\ Vehicle\ Type}(Average\ Vehicle\ Weight \cdot Peak\ Volume\ by\ Vehicle)}{Peak\ Vehicle\ Volume}$$

The following sample calculations are based on data for Model Source ID “A01” in **Appendix A.4** *Year 2041 Detailed Traffic Data and Fugitive Particulate Matter Emissions, Build Scenario, Model Section 1.1*. Vehicle composition for Passenger Cars is from **Appendix A.2.1**: *AM Traffic Composition by Source for 2041 Build Scenario*.

$$AM\ Peak\ Volume = 3965 \cdot 28\%$$

$$= 1121\ Passenger\ Cars$$

Continuing for Model Source ID “A01” on Appendix A.4, the table columns identified as AM Peak Volume by Vehicle have vehicle counts and average vehicle weight by vehicle type:

$$Weighted\ Average\ Vehicle\ Weight_{A01,AM}$$

$$= \frac{(1.76 \cdot 1121) + (1.99 \cdot 1877) + (15.51 \cdot 476) + (15.35 \cdot 21) + (22.51 \cdot 246) + (24.36 \cdot 224)}{3965}$$

$$= 6.2\ US\ short\ tons$$

Sample calculation for PM_{10} AM Emission Rate 2041 Build Scenario and Roadway Segment Hwy 413 N of Hwy 401/407 interchange – NB (A01):

$$E_{\text{A01,AM Peak PM10}} = 0.62 \cdot 0.015^{0.91} \cdot 6.2^{1.02}$$

$$= \frac{0.087g}{VKT}$$

$$= 0.154\ g/s \cdot mile$$

Appendix A5. Raw Traffic Data: Summarized raw traffic data used as the base for the air quality analysis.

2.5 Key Air Contaminants

Vehicular traffic generates a variety of air contaminants from fuel combustion inside the engine, evaporation of fuel from the tank, brake and tire wear, and re-suspension (also known as re-entrainment) of loose particles on the road surface (silt) as the vehicle travels over the road surface. The following key contaminants were assessed:

- Respirable particulate matter ($PM_{2.5}$)
- Inhalable particulate matter (PM_{10})
- Carbon monoxide (CO)
- Nitrogen dioxide (NO_2)
- Acetaldehyde
- Acrolein

- Benzene
- 1,3-Butadiene
- Benzo(a)pyrene
- Formaldehyde

These contaminants are specified in the MTO Air Quality Guide (MTO, 2020) as those most relevant for inclusion in the comprehensive local air quality analysis. Ground level ozone is not included in a local air quality assessment based on this guideline. Although the health effects and environmental effects of ground level ozone are significant, ground level ozone is not a primary pollutant emitted directly into air, but is a secondary pollutant created by chemical reactions between nitrogen oxides (NOx) and volatile organic compounds (VOCs) in the presence of heat and sunlight. The photochemical reactions can take at least a few hours to occur, which means the precursors and resulting ozone would be transported out of the local environment.

2.6 Air Quality Thresholds

The MECP has established Ontario Ambient Air Quality Criteria (AAQC) for airborne concentrations of the key air contaminants considered in this assessment. The Canadian Council of Ministers of the Environment (CCME) has established Canadian Ambient Air Quality Standards (CAAQS) for 1-hour and annual concentrations of NO_2, which came into effect on January 1, 2025, as well as 24-hour and annual concentrations of $PM_{2.5}$, which came into effect July 4, 2025 (CCME, 2025). The AAQC for $PM_{2.5}$ is based on the earlier CAAQS 2020 threshold value. The AAQC and CAAQS are collectively referred to as air quality thresholds in this report.

The CAAQS were developed for use by provinces and territories to guide air zone management actions. They are not project-level regulatory standards, and they are not to be considered as “pollute-up-to” levels. Increasing contaminant levels when compared to the AAQC and CAAQS may lead to increasing air quality management actions. Measures mandated to achieve the CAAQS should consider technical achievability, practicality, and implementation costs (CCME, 2019).

The thresholds are summarized in **Table 2-1**.

Table 2-1: Summary of Relevant Air Quality Thresholds

Contaminant	Averaging Period	Threshold (µg/m^3)	Source [5]
$PM_{2.5}$	24-hour	27	AAQC / CAAQS 2020 [1]
	24-hour	23	CAAQS 2030 [1]
	Annual	8.8	AAQC / CAAQS 2020 [2]
	Annual	8.0	CAAQS 2030 [2]
PM_{10}	24-hour	50	AAQC
CO	1-hour	36,200	AAQC
	8-hour	15,700	AAQC
NO_2	1-hour	400	AAQC
	1-hour	83.1	CAAQS 2025 [3]
	24-hour	200	AAQC
	Annual	23.7	CAAQS 2025 [4]
Benzo(a)pyrene	24-hour	5.0E-05	AAQC
	Annual	1.0E-05	AAQC
Acetaldehyde	0.5-hour	500	AAQC
	24-hour	500	AAQC
Acrolein	1-hour	4.5	AAQC
	24-hour	0.4	AAQC
Formaldehyde	24-hour	65	AAQC
Benzene	24-hour	2.3	AAQC
	Annual	0.45	AAQC
1,3-Butadiene	24-hour	10	AAQC
	Annual	2	AAQC

Notes:

[1] The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations.

[2] The 3-year average of the annual average concentrations.

[3] The 3-year average of the annual 98th percentile daily maximum 1-hour average concentrations. Threshold converted from ppb to µg/m^3 at 10ºC and 101.325 kPa.

[4] The average over a single calendar year of all the 1-hour average concentrations. Threshold converted from ppb to µg/m^3 at 10ºC and 101.325 kPa.

2.7 Background Air Quality Data

Ambient background data for each key contaminant were obtained from representative air quality monitoring stations within the ECCC National Air Pollution Surveillance (NAPS) Program and MECP ambient air monitoring station network.

Current land use in the study area is predominantly rural, with some sections having low- to medium-density residential, commercial developments, and industrial activities. It is expected that residential, commercial, and industrial developments will continue within the corridor in future, and the future traffic projections on arterial roads and highways that were used in the assessment already account for this future development. Ambient air quality data from ECCC National Air Pollution Surveillance (NAPS) Program and MECP ambient air monitoring stations are reflective of the existing conditions at the time of the study. Since emissions from vehicle traffic on arterial roads and highways were modelled, ambient air quality stations that are heavily impacted by the proximity of major highways were not used. Similarly, since industrial developments in the study area are expected to be primarily logistics and warehousing, NAPS stations that are influenced by the proximity of heavy industry, such as steel making, were not used. The stations that were used in calculation of background are located in urban centres, including Brampton, north and downtown Toronto, and the Town of Newmarket. The ambient concentrations of VOCs from Newmarket are comparable to the ambient VOC concentrations in the cities of Kitchener and London. This mix of stations from medium to large urban centres in southern Ontario is reflective of potential future developments in the study as it incorporates background air quality concentrations from urban residential, commercial, industrial, and road network activity.

The Brampton station (NAPS ID 60450) was used for background concentrations of $PM_{2.5}$, PM_{10}, and NO_2 for 2018 to 2022. This station is closest to the study area and is reasonably representative of local conditions.

Toronto North – Downsview station (NAPS ID 60440) was used for carbon monoxide (CO) for 2018 to 2022. Stations monitoring for this contaminant are limited and this is the closest station that is the most representative of the land use of the study area.

Data for volatile organic compounds (VOCs) are only available at select monitoring stations. For benzene and 1,3-butadiene, the Newmarket (NAPS ID 65101) station was used for 2017 to 2022, excluding 2021 when no data was available. This station is the closest available to the eastern part of the study area, and it is generally most representative of the land use characteristics throughout the study area.

Recent data for benzo(a)pyrene are only available from a very limited number of monitoring stations. Simcoe Experimental Farm (NAPS ID 62601) is the most representative of the current rural characteristics of the study area; however, it would likely underestimate future background concentrations due to anticipated development. In contrast, Roadside 401W – Toronto (NAPS ID 60438), situated approximately 10 m from Highway 401, would likely overestimate background levels for the study area. Multiple Toronto-based stations were selected, including Gage Institute (NAPS ID 60427) for 2014, Roadside – Wallberg (University of Toronto) (NAPS ID 60439) for 2015, and Toronto West-125 Resources Rd (NAPS Station 60430) for 2016 to 2018.

Similar to benzo(a)pyrene, data for carbonyls are only available from a very limited number of monitoring stations. The Simcoe Experimental Fam and Roadside 401W – Toronto NAPS stations provide data for carbonyls; however, as for benzo(a)pyrene, they were still deemed not representative of project background. Therefore, Roadside – Wallberg (University of Toronto) (NAPS ID 60439) was used for acrolein, acetaldehyde, and formaldehyde for 2014 to 2017.

The sources of background monitoring data used for this study are presented in **Table 2-2**. The locations of these ambient monitoring stations are shown in **Appendix D.1A**.

Table 2-2: Source of Background Monitoring Data

Contaminant	NAPS ID and Location	Years Included [1, 2]
$PM_{2.5}$	60450 – BRAMPTON	2018, 2019, 2020, 2021, 2022
PM_{10} [1]	60450 – BRAMPTON	2018, 2019, 2020, 2021, 2022
CO	60440 – TORONTO NORTH - DOWNSVIEW	2018, 2019, 2020, 2021, 2022
NO_2	60450 – BRAMPTON	2018, 2019, 2020, 2021, 2022
Benzo(a)pyrene [2]	60427 – GAGE INSTITUTE 60439 – ROADSIDE - WALLBERG (UofT) 60430 – TORONTO WEST-125 RESOURCES ROAD	2014 2015 2016, 2017, 2018
Acetaldehyde [2]	60439 – ROADSIDE - WALLBERG (UofT)	2014, 2015, 2016, 2017
Acrolein [2]	60439 – ROADSIDE - WALLBERG (UofT)	2014, 2015, 2016, 2017
Formaldehyde [2]	60439 – ROADSIDE - WALLBERG (UofT)	2014, 2015, 2016, 2017

Contaminant	NAPS ID and Location	Years Included [1, 2]
Benzene [3]	65101 – EAGLE ST. & McCAFFREY RD. NEWMARKET	2017, 2018, 2019, 2020, 2022
1,3-Butadiene [3]	65101 – EAGLE ST. & McCAFFREY RD. NEWMARKET	2017, 2018, 2019, 2020, 2022

Notes:

[1] PM_{10} background data is based on $PM_{2.5}$.

[2] Most recent data available at this station.

[3] No data for 2021 at this station.

For NO_2 and ozone (O_3), hourly monitoring data were available for the local Brampton monitoring station that allowed estimation of background concentration by hour of day. Project contribution of ozone was not assessed against air quality thresholds, but background ozone concentrations were used for converting NO_x to NO_2 using the Ozone Limiting Method (OLM). As background concentrations vary widely from day to day, the 90th percentile concentration was calculated for each hour of the day using 5 years of hourly monitoring data from 2019 to 2023, as this represents the most recent data set available and matches the time span of meteorological data provided by the MECP. The resulting background concentrations reflect the highest likely background levels expected to coincide with peak roadway-related concentrations. These values were applied to predict the maximum 1-hour and 24-hour cumulative concentrations of NO_2. The hourly background concentrations for NO_2 and O_3 are presented in **Appendix B**. For the annual averaging period the annual mean values were used.

PM_{10} monitoring data were not available; therefore, PM_{10} background concentrations were estimated from the $PM_{2.5}$ values using a $PM_{2.5}/PM_{10}$ ratio of 0.54, which represents the mean $PM_{2.5}/PM_{10}$ ratio for 133 Metropolitan Statistical Areas in the United States based on a multi-year historical dataset from the United States Environmental Protection Agency's Aerometric Information Retrieval System (AIRS) (Lall et. al., 2004). A similar study using ten years of sampling data from Canadian NAPS locations found a mean $PM_{2.5}/PM_{10}$ ratio of 0.6 for Toronto and 0.61 for Egbert, north of Toronto (Brook et. al., 1997). Urban areas with industrial emissions and vehicle traffic often have higher $PM_{2.5}$ due to finer particles from combustion, leading to higher ratios, while regions with more dust, such as the prairies, might show lower ratios of $PM_{2.5}/PM_{10}$. A ratio of 0.54 provides a higher, more conservative, estimate of background PM_{10} compared to a ratio of 0.6, so the ratio of 0.54 from Lall et. al. was used.

For benzene and benzo(a)pyrene, the monitoring data consisted of 24-hour average concentrations. The 90th percentile values were used as the background concentration. For 0.5-hour acetaldehyde and 1-hour acrolein, the background values were calculated from the corresponding 24-hour average background value following Section 4.4 of the MECP Air Dispersion Modelling Guideline for Ontario.

Table 2-3 presents a summary of background concentrations of the various air contaminants for averaging periods appropriate for comparison with relevant ambient air quality thresholds. These concentrations represent the 90th percentile values which were added to model-predicted concentrations from project-related emissions.

Table 2-3: Summary of Background Concentrations

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Description[3]	Air Quality Threshold	% of Threshold
$PM_{2.5}$	24-hour	12.2	90th Percentile	27	45%
	24-hour	12.2	90th Percentile	23	53%
	Annual	7.0	Annual Average	8.8	80%
	Annual	7.0	Annual Average	8.0	88%
PM_{10}	24-hour	22.6	90th Percentile	50	45%
CO	1-hour	349	90th Percentile	36,200	<1%
	88-hour	362	90th Percentile	15,700	2%
NO_2	1-hour	35.0	90th Percentile	83.1	42%
	24-hour	29.4	90th Percentile	200	15%
	Annual	14.7	Annual Average	23.7	62%
Benzo(a)pyrene	24-hour	9.1E-05	90th Percentile	5.0E-05	183%
	Annual	5.1E-05	Annual Average	1.0E-05	513%
Acetaldehyde	0.5-hour [1]	4.43	90th Percentile	500	<1%
	24-hour	1.5	90th Percentile	500	<1%
Acrolein	1-hour [2]	0.15	90th Percentile	4.5	3%
	24-hour	0.06	90th Percentile	0.4	16%
Formaldehyde	24-hour	2.55	90th Percentile	65	4%
Benzene	24-hour	0.46	90th Percentile	2.3	20%
	Annual	0.31	Annual Average	0.45	68%

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Description[3]	Air Quality Threshold	% of Threshold
1,3-Butadiene	24-hour	0.03	90th Percentile	10	<1%
	Annual	0.01	Annual Average	2	<1%

Notes:

[1] 0.5-hour average converted from 24-hour average background value following the method described in Section 4.4 of the Air Dispersion Modelling Guideline for Ontario.

[2] 1-hour average converted from 24-hour average background value following the method described in Section 4.4 of the Air Dispersion Modelling Guideline for Ontario

[3] The MTO Air Quality Guide considers the 90th percentile approach acceptable, however, this method does not align with the statistical form used for CAAQS.

2.8 Emissions Model

The standard approach for estimating vehicular emissions is to use computer simulation techniques that are based on extensive previous testing of a wide range of vehicles. Motor Vehicle Emission Simulator (MOVES4) is such a model that has been developed for this purpose by the US EPA. MOVES4 was used to generate vehicle emission factors for the horizon years 2041 and 2051. **Tables 2-4, 2-5, and 2-6** summarize the inputs used for the MOVES model runs for vehicle types and contaminants that were considered in this assessment.

Exhaust emissions vary widely by vehicle type and speed, and MOVES4 was configured to generate emission factors based on the vehicle type and travel speed. These individual emission factors were aggregated to produce a composite emission factor for each key air contaminant, representing the average vehicle for each road segment assessed as well as the road's vehicle volume. Aggregate MOVES emission factors by roadway segment, which are the sum of the emission factors for each roadway's various vehicle types, are provided in **Appendix F**.

The aggregate emission factors (g/s·mile) for each Source ID based on AM Peak traffic for Model Section 1 of the 2041 Build scenario are provided in **Appendix F.1.3**.

As an example, Line Area Source ID "A01" shows an aggregate emission factor of 2.84E-04 g/s-mile for acetaldehyde in the first row of **Appendix F.1.3**. Line Area Source ID "A01" is a segment of mainline Highway 413 which was modelled as Urban Restricted (MOVES Road Type ID 4) with an assumed speed of 110 km/h. This combination of road type and speed was assigned MOVES LinkID 17. The MOVES

emission factors are shown in **Appendix F.1.1**. For a Passenger Car (MOVES Source Type ID 21), Road Type ID 4, and Speed 110 km/h, the MOVES emission factor from **Appendix F.1.1** is 4.17E-05 g/mile. **Appendix F.1.2** summarizes the hourly vehicle traffic volume by vehicle type. For Source ID "A01" there are 1121 Passenger Cars per hour. The emission factor shown in **Appendix F.1.2** multiplies the hourly vehicle volume by the associated MOVES emission factor from **Appendix F.1.1** and divides by 3600 seconds per hour to calculate an intermediate emission factor in units of g/s-mile. The aggregate emission factor for each road segment in **Appendix F.1.3** is the sum of the emission factors by vehicle type for that road segment as calculated in **Appendix F.1.2**. The aggregate emission factor can be summarized with the following equation, with data for Source ID "A01" in Model Section 1 substituted in as follows:

$$EF_{A01,ACT} = \sum_{Vehicle\ Classes} \left(\frac{ER \cdot V}{3600}\right)$$

$$= \frac{(ER_{PC} \cdot V_{PC} + ER_{PT} \cdot V_{PT} + ER_{SSHT} \cdot V_{SSHT} + ER_{SLHT} \cdot V_{SLHT} + ER_{CSHT} \cdot V_{CSHT} + ER_{CLHT} \cdot V_{CLHT})}{3600}$$

$$= \frac{(4.17E^{-5} \cdot 1121 + 5.40E^{-5} \cdot 1877 + 4.76E^{-4} \cdot 476 + 4.62E^{-4} \cdot 21 + 1.36E^{-3} \cdot 246 + 1.35E^{-3} \cdot 224)}{3600}$$

$$= 2.84E^{-4} g/s \cdot mile$$

Where:

- ER = MOVES4 emission factor for the specified contaminant (g/mile)
- V = vehicle volume (vehicles/hour)
- Vehicle Classes for A01
    - Passenger Car (PC)
    - Passenger Truck (PT)
    - Single Unit Short Haul Truck (SSHT)
    - Single Unit Long Haul Truck (SLHT)
    - Combination Short Haul Truck (CSHT)
    - Combination Long Haul Truck (CLHT)

For particulate matter, it is necessary to account for the re-suspension of dust as vehicles travel over a roadway surface, in addition to tailpipe emissions. The road dust emissions were calculated based on the revised version of US EPA's AP-42, Chapter 13.2.1 (US EPA, 2011). The aggregated tailpipe emission factor for particulate matter obtained from MOVES4 (as an example, **Appendix F.1.5**) was added to the road dust emission factor as calculated in **Appendix A.4** to account for both emission sources. A sample calculation for this step is shown below for 2041 Build, Model Section 1, Source ID "A01" for PM peak. The values in the **Appendix F.1.5** and **Appendix A.4** tables are rounded, but the values shown in the sample calculation have not been rounded.

$$EF_{PM_{10}} = EF_{PM_{10,tailpipe}} + EF_{PM_{10,road\ dust}}$$

$$EF_{PM_{10}} = 0.015465 \frac{g}{s \times mile} + 0.1347 \frac{g}{s \times mile}$$

$$EF_{PM_{10}} = 0.150165 \frac{g}{s \times mile}$$

Where, for this road section:

- $EF_{PM_{10}}$ = Total emission factor for PM_{10}.
- $EF_{PM_{10,tailpipe}}$ = Tailpipe emission factor for PM_{10}.
- $EF_{PM_{10,road\ dust}}$ = Road dust emission factor for PM_{10}.

MOVES4 default data were used to represent the percentages of electric vehicles in the future Ontario fleet. MOVES4 default data represents a moderate assumption of EV adoption, with the EV percentage of new vehicle sales increasing to 44% (passenger cars) and 37% (passenger trucks) in 2030, declining slightly to 30% in 2034, and followed by a modest annual increase to 2050, (US EPA, 2023). This represents a lower rate of EV adoption, and therefore a more conservative basis for emissions estimation, than that outlined in the recently updated strategy for the Canadian auto industry which sets a goal of 75% EV sales by 2035 and 90% EV sales by 2040 (Government of Canada, 2026).

For modelling years after 2040, MOVES4 emission factors for 1,3-butadiene for all vehicle types are zero due to US EPA updates of the toxic fractions of VOCs in vehicle exhaust (US EPA, 2020); therefore, results for 1,3-butadiene were not quantified in **Appendix C** and the 1,3-butadiene ambient background concentrations are shown in these tables for all receptors.

Table 2-4: MOVES4 General Parameters

Input Parameter	Value / Setting
Scale	**Model**: On-road **Domain/Scale**: Project Scale **Calculation Type**: Inventory
Time Span [1]	**Years**: 2041, 2051 **Months**: January, July **Days**: Weekdays **Hours**: 7:00-7:59 (8 AM), 11:00-11:59 (12 PM), 2:00-2:59 (3 PM), 17:00-17:59 (18 PM)
Geographic Boundaries	NEW YORK - Erie County [22]
Road Type	Rural Restricted Access Rural Unrestricted Access Urban Restricted Access Urban Unrestricted Access
General Output	**Units**: Grams/Joules/Miles **Activity**: Distance traveled, Population
Output Emissions Detail	**Output Aggregation**: N/A **Vehicle/Equipment Categories**: Emission Process **On-road**: Road Type, Source Use Type **Nonroad**: N/A

Notes:

[1] For each modelling year, 2041 and 2051, and each model section, the maximum MOVES emission factor from these time spans was used for calculating tailpipe emission rates.

[22] NEW YORK - Erie County was selected as the United States county most closely representing the study area. MOVES model runs were completed for each of the five model sections using the site-specific meteorological data provided by MECP for these model sections.

Table 2-5: MOVES4 On-road Vehicles

Vehicle Class	Fuels Modelled	Notes / Examples
Passenger Car	MOVES4 defaults for Gasoline, Diesel, Electricity, Ethanol (E85)	Includes all light-duty 2-axle passenger cars
Passenger Truck	MOVES 4 defaults for Gasoline, Diesel, Electricity, Ethanol (E85)	Light-duty pickups, SUVs, and vans
Combination Long-haul Truck	MOVES4 defaults for Diesel, CNG, Electricity	Class 8 tractor-trailers operating long-haul

Vehicle Class	Fuels Modelled	Notes / Examples
Combination Short-haul Truck	MOVES4 defaults for Gasoline, Diesel, CNG, Electricity	Class 8 tractor-trailers local/regional
Single Unit Long-haul Truck	MOVES4 defaults for Gasoline, Diesel, CNG, Electricity	Heavy single-unit trucks for long-haul
Single Unit Short-haul Truck	MOVES4 defaults for Gasoline, Diesel, CNG, Electricity	Heavy single-unit trucks for local/regional

Table 2-6: Pollutants and Processes

Pollutant Group	Pollutants	Processes Included
Methane & Carbon Compounds	Methane (CH_4), Carbon Monoxide (CO))	Running Exhaust, Crankcase Running Exhaust
Nitrogen Compounds	Oxides of Nitrogen (NO_x), Nitrogen Dioxide (NO_2), Nitrous Oxide (N_2O)	Running Exhaust, Crankcase Running Exhaust
Particulate Matter (PM)	Primary Exhaust $PM_{2.5}$ – Total, Primary Exhaust PM_{10} – Total	Running Exhaust, Crankcase Running Exhaust
	Primary $PM_{2.5}$ – Brake wear Particulate, Primary PM_{10} – Brake wear Particulate	Brake wear
	Primary $PM_{2.5}$ – Tire wear Particulate, Primary PM_{10} – Tire wear Particulate	Tire wear
Air Toxics & Hazardous Pollutants	Benzene, 1,3-Butadiene, Formaldehyde, Acetaldehyde, Acrolein, Benzo(a)pyrene Particle	Running Exhaust, Crankcase Running Exhaust

2.9 Dispersion Model

Air contaminants emitted from vehicles on a roadway will drift downwind and disperse as they travel. The degree to which the contaminants disperse depends on the weather-related factors, such as wind speed, wind direction, atmospheric stability, surface roughness, and amount of mechanical turbulence. The typical approach to determining potential future downwind concentrations from a proposed project is to use a computer simulation that predicts the dispersal of air pollutants as they drift away from the roads. These simulations are referred to as dispersion models.

Dispersion modelling is a common approach for assessing local air quality near an emission source such as vehicular traffic. The dispersion model used in this study is the US EPA's AERMOD (version 22112). AERMOD is widely used and is an approved model for regulatory purposes in Ontario. The model predicts how emissions from the vehicles travelling within each segment disperse and contribute to air pollutant concentrations within the study area. The dispersion model requires information on emission rates for the air pollutants of interest, the layout of the project corridor, terrain elevation data, and hourly meteorological data.

Meteorological data from 2019 to 2023 was provided by the Ministry of the Environment, Conservation and Parks (MECP) for five monitoring stations. To align with these datasets, the Air Quality Study Area was divided into five corresponding subsections, each associated with one of the meteorological stations. Overlap between adjacent subsections was included to ensure that transitional meteorological influences on dispersion were appropriately captured. The model sections are shown in **Appendix D.1**. Wind roses showing the variation in wind speed and direction in each of the five meteorological datasets are provided in **Appendix H**.

To facilitate efficient model execution, sources modelled in each model section included only those sources that were whole or in part within the model section or in either of the immediately adjacent model sections. It was assumed that sources that were further away would have minimal impact on the modelled maximum concentrations at receptors. This assumption was tested for 24-hour $PM_{2.5}$ using a single receptor located at the southern end of model section #3. Results from a model run using the entire 5-year meteorological dataset were used to determine the day having the maximum concentration at that receptor. Results from two model runs, the first using all sources in the model and the second using only the sources assigned to that model section, were compared to determine the variance. With all sources, the 24-hour average concentration was 7.53123 $\mu g/m^3$ and with only the sources for that model section the concentration was 7.53101 $\mu g/m^3$, an insignificant difference of less than 0.003%.

Terrain information for the study area was obtained from the Regional Meteorological and Terrain Data for Air Dispersion Modelling website of the MECP. The terrain data are based on the North American Datum 1983 (NAD83) horizontal reference datum. The rural dispersion coefficient was used in the dispersion modelling analysis.

AERMOD was used to predict the contribution of the modelled roadways to concentrations of contaminants at nearby sensitive receptors. Roadways were modelled using the "LINE AREA" source type in AERMOD. The "LINE AREA" source type treats the roadway as an area source with a uniform pollutant emission rate per area (g/s-m^2). Emission inputs were generated by the MOVES4 model as described in Section 2.8 using the traffic data described in Section 2.4. For receptors located in an area of two overlapping model sections, the maximum of the two modelled results was used for that receptor. The predicted maximum concentrations were combined with estimated background concentrations that are due to other emission sources in the surrounding area, thus providing a prediction of maximum cumulative concentrations. **Appendix C.1 and C.2** show the maximum predicted concentrations for the 2041 Future No-Build and Future Build scenarios, respectively. **Appendix C.4 and C.5** show the results for 2051 No-Build and Build.

2.9.1 Selection of Receptors

A combination of interactive GIS maps and satellite imagery were used to determine the locations of all representative sensitive receptors (e.g. residential dwellings) and critical receptors (e.g. retirement homes, hospitals, childcare centres, schools) within the study area. The same receptors were used for the No-Build and Build scenarios. Background concentrations were assumed the same at each receptor location. Local air quality impacts are expected to be greatest at receptors closest to the modelled roadways. Figures in **Appendix D.2** and **D.3** show the sensitive receptor locations within the study area.

Future residences that have been publicly approved at the time this study commenced have been included. The analysis excludes properties that have been acquired by MTO. In future, if these properties are determined to no longer be needed to support the Highway 413 Construction or Operation, the MTO will follow Ontario's Realty Directive to dispose of surplus land (Ministry of Infrastructure, 2024). Review of potential air quality impacts can be made at that time.

Additional locations where Indigenous communities may be exercising rights can be identified through MTO consultation, and these can be assessed as part of Detail Design.

2.9.2 Conversion of NO_x to NO_2, Ozone Limiting Method

Any chemical reactions among pollutants are not considered in the assessment of local air quality impacts, except for the conversion of nitric oxide (NO) to NO_2, through reaction with ambient ground-level O_3. Vehicle exhausts initially consist mainly of NO. However, NO can convert to NO_2 once in the outside air. The Ozone Limiting Method (OLM) was used to estimate this conversion for the credible worst-case NO concentration.

The OLM assumes that the conversion of NO to NO_2 is limited only by the amount of ozone (O_3) present in the outside air. If the concentration of available O_3 (parts per million or ppm) is less than that of the NO contributed by the modelled roadway emissions, then the portion of NO that is converted to NO_2 equals the available O_3. On the other hand, if the concentration of available O_3 exceeds that of the NO contributed by the modelled roadway, then all of the NO is converted to NO_2. The OLM calculation is conditional dependent on the ambient concentration of ozone compared to the concentration of NOx from combustion. These are shown below as (a) and (b).

(a) $$If\ ambient\ O_3 > [0.9 \times NOx], then\ NO_2 = NOx$$

(b) $$If\ ambient\ O_3 < [0.9 \times NOx], then\ NO_2 = [0.1 \times NOx] +\ O_3$$

For example, the concentration of ambient ozone at 12 p.m. is 46 ppb (parts per billion) as shown in **Appendix B**. Assuming the concentration of NOx at 12 p.m. is 100 ppb, equation (b) would apply as shown below.

$$46\ ppb < [0.9 \times 100\ ppb], so\ NO_2 = [0.1 \times 100\ ppb] + 46\ ppb$$

$$= 10\ ppb + 46\ ppb = 56\ ppb$$

For the credible worst-case analysis, a fixed hourly concentration of ozone was used in the OLM, shown in **Appendix B**, corresponding to the 90th percentile of measured values from historical monitoring data recorded at the Brampton monitoring station operated by the MECP.

3. Existing Conditions

3.1 Baseline Conditions

The No-Build scenario represents traffic volumes on existing roadways and highways within the study area, and assessment of the air quality impacts under these future conditions effectively provides a baseline for comparison of the effects from the future operations of Highway 413.

The 2041 and 2051 No-Build traffic data was assessed following the methods described in Section 2 of this report.

3.2 Assessment of Maximum Cumulative Concentrations

A summary of the predicted maximum cumulative concentrations for the No-Build scenario for each contaminant (maximum modelled project contribution plus the 90th percentile 0.5-hour, 1-hour, 8-hour, or 24-hour background concentration) at the 3,034 modelled discrete receptors is presented in **Appendix C.1 and C.4** for 2041 and 2051 respectively. Five model runs were completed, one for each set of prepared meteorological data. The maximum resultant concentrations from the models at each receptor for each contaminant were compared to the applicable thresholds.

Table 3-1 and **Table 3-2** present the maximum cumulative concentrations for the No-Build 2041 and 2051 scenarios respectively.

Table 3-1: Maximum Cumulative Concentration – No-Build 2041

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold
$PM_{2.5}$	24-hour	12.2	20.7	27	77%
	24-hour	12.2	20.7	23	90%
	Annual	7.0	8.9	8.8	101%
	Annual	7.0	8.9	8.0	111%
PM_{10}	24-hour	22.6	62.8	50	126%
CO	1-hour	349	2547	36,200	7%
	8-hour	362	1006	15,700	6%

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold
NO_2	1-hour	35.0	129.4	83.1	156%
	24-hour	29.4	67.3	200	34%
	Annual	14.7	22.7	23.7	96%
Benzo(a)pyrene	24-hour	9.1E-05	1.79E-04	5.0E-05	358%
	Annual	5.1E-05	6.73E-05	1.0E-05	673%
Acetaldehyde	0.5-hour [1]	4.43	4.91	500	<1%
	24-hour	1.5	1.56	500	<1%
Acrolein	1-hour [2]	0.15	0.18	4.5	4%
	24-hour	0.06	0.07	0.4	17%
Formaldehyde	24-hour	2.55	2.61	65	4%
Benzene	24-hour	0.46	0.55	2.3	24%
	Annual	0.31	0.32	0.45	72%
1,3-Butadiene	24-hour	0.03	0.03	10	<1%
	Annual	0.01	0.01	2	<1%

Table 3-2: Maximum Cumulative Concentration – No-Build 2051

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold
$PM_{2.5}$	24-hour	12.2	21.6	27	80%
	24-hour	12.2	21.6	23	94%
	Annual	7.0	9.1	8.8	103%
	Annual	7.0	9.1	8.0	114%
PM_{10}	24-hour	22.6	67.7	50	135%
CO	1-hour	349	1971	36,200	5%
	8-hour	362	848	15,700	5%
NO_2	1-hour	35.0	125.7	83.1	151%
	24-hour	29.4	61.9	200	31%
	Annual	14.7	21.4	23.7	90%

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold
Benzo(a)pyrene	24-hour	9.1E-05	1.56E-04	5.0E-05	311%
	Annual	5.1E-05	6.36E-05	1.0E-05	636%
Acetaldehyde	0.5-hour [1]	4.43	4.79	500	<1%
	24-hour	1.5	1.54	500	<1%
Acrolein	1-hour [2]	0.15	0.17	4.5	4%
	24-hour	0.06	0.07	0.4	16%
Formaldehyde	24-hour	2.55	2.59	65	4%
Benzene	24-hour	0.46	0.54	2.3	24%
	Annual	0.31	0.32	0.45	72%
1,3-Butadiene	24-hour	0.03	0.03	10	<1%
	Annual	0.01	0.01	2	<1%

For the No-Build scenario, the cumulative maximum predicted concentrations for 24-hour and annual average benzo(a)pyrene exceeded the AAQC. This is attributed in part to high ambient background concentrations, as the background levels of benzo(a)pyrene are 183% and 513% of the AAQC for 24-hour and annual averaging periods, respectively. However, the maximum cumulative concentrations in No-Build 2041 are 358% and 673% for 24-hour and annual averaging periods, respectively. This means that the non-background contribution is 175% and 160% respectively, both of which exceed AAQC.

In 2041, the cumulative maximum predicted concentrations for all other contaminants were below their respective thresholds except annual $PM_{2.5}$ which exceeded both AAQC and CAAQS with 71 receptors showing exceedance of the CAAQS, 24-hour PM_{10} which exceeded AAQC at 31 receptors, and 1-hour NO_2 which exceeded CAAQS at 466 receptors. Most of these exceedances occur at receptors that are closest in proximity to the Highway 401 and 407 ETR interchange. In 2051, the cumulative maximum predicted concentrations for all other contaminants were below their respective thresholds except annual $PM_{2.5}$ which exceeded both AAQC and CAAQS with 91 receptors showing exceedance of the CAAQS, 24-hour PM_{10} which exceeded AAQC at 74 receptors, and 1-hour NO_2 which exceeded CAAQS at 220 receptors. Similar to 2041, most of these exceedances occur at receptors that are closest in proximity to the Highway 401 and 407 ETR interchange.

The concentration isopleths in **Appendix E.2 and E.14** show the impacts for NO_2 within the study area, with higher levels of NO_2 near Highway 401 and 407 ETR in the west and Highway 400 in the east, and much lower levels below the 1-hour NO_2 CAAQS threshold generally throughout the remainder of the study area. The concentration isopleths in **Appendix E.5 and E.17** show similar trends in impacts for 24-hour PM_{10} within the study area, while **Appendix E.8 and E.20** show similar trends for Annual $PM_{2.5}$.

3.3 Frequency Analysis for 1-Hour NO_2 and 24-Hour PM_{10}

The frequency analysis for 1-hour NO_2 presented in **Appendix G.1.1** shows exceedance at the most impacted receptor, RE110000_005, 2.4% of the time. This receptor as well as the others having frequency of exceedance greater than 1% are located directly beside Highway 401. The frequency of exceedance generally approaches zero at some point within the study area. However, the distance at which this occurs varies throughout the project. **Appendix E.2** shows the areas expected to have a non-zero frequency of exceedance in greater detail.

The frequency analysis for 24-hour PM_{10} presented in **Appendix G.2.1** shows exceedance at the most impacted receptor, RE110000_005, 1.0% of the time. This receptor is located directly beside Highway 401. Similar to NO_2, the frequency of exceedance generally approaches zero at some point within the study area. However, the distance at which this occurs varies throughout the project. **Appendix E.2** shows the areas expected to have a non-zero frequency of exceedance in greater detail.

It is not possible to configure the modelling files within AERMOD to return a count of exceedance of the CAAQS threshold. The frequency analyses are based on exceedance of standard by the maximum predicted concentration, and therefore the frequencies reported are more conservative than would be expected based on the CAAQS.

4. Potential Impacts and Mitigation

4.1 Future Build Conditions

The Build scenario represents traffic volumes on the Highway 413 and any associated ramps and interchanges as well as existing roadways and highways within the study area, and assessment of the air quality impacts under these future conditions is compared to the No-Build conditions to gauge the net impacts from future operations of Highway 413.

The Build scenario traffic data was assessed following the methods described in Section 2 of this report.

4.2 Assessment of Maximum Cumulative Concentrations

A summary of the predicted maximum cumulative concentrations for the Build scenario for each contaminant (maximum modelled project contribution plus the 90th percentile 0.5-hour, 1-hour, 8-hour, or 24-hour background concentration) at the 3,034 modelled discrete receptors is presented in **Appendix C.2 and C.5** for 2041 and 2051, respectively. Five model runs were completed, one for each set of prepared meteorological data. The maximum resultant concentrations from the models at each receptor for each contaminant were compared to the applicable thresholds in **Table 4-1** and **4-2**. The 2041 Build "% of threshold" is included in **Table 4-2** to provide a comparison between 2051 and 2041 concentrations. Although traffic volumes are predicted to increase between 2041 and 2051, tailpipe emissions for all contaminants are projected to decrease due to improved engine technology and additional fleet conversion to electric vehicles. However, the total emissions of particulate matter are predicted to increase due to re-entrainment of road dust from the increased vehicle traffic.

Table 4-1: Maximum Cumulative Concentration – Build 2041

Contaminant	Averaging Period	Adopted Background Concentration (µg/m^3)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold
$PM_{2.5}$	24-hour	12.2	23.6	27	87%
	24-hour	12.2	23.6	23	102%
	Annual	7.0	9.1	8.8	103%
	Annual	7.0	9.1	8.0	113%
PM_{10}	24-hour	22.6	78.2	50	156%
CO	1-hour	349	3068.7	36,200	8%
	8-hour	362	1128.6	15,700	7%
NO_2	1-hour	35.0	131.1	83.1	158%
	24-hour	29.4	73.1	200	37%
	Annual	14.7	22.9	23.7	97%
Benzo(a)pyrene	24-hour	9.1E-05	1.93E-04	5.0E-05	386%
	Annual	5.1E-05	6.89E-05	1.0E-05	689%
Acetaldehyde	0.5-hour [1]	4.43	5.0	500	<1%
	24-hour	1.5	1.6	500	<1%
Acrolein	1-hour [2]	0.15	0.19	4.5	4%
	24-hour	0.06	0.07	0.4	17%
Formaldehyde	24-hour	2.55	2.62	65	4%
Benzene	24-hour	0.46	0.57	2.3	25%
	Annual	0.31	0.33	0.45	72%
1,3-Butadiene	24-hour	0.03	0.03	10	<1%
	Annual	0.01	0.01	2	<1%

Table 4-2: Maximum Cumulative Concentration – Build 2051

Contaminant	Averaging Period	Adopted Background Concentration (µg/m³)	Maximum Cumulative Concentration	Air Quality Threshold	% of Threshold	% of Threshold 2041 Build
$PM_{2.5}$	24-hour	12.2	24.5	27	91%	87%
	24-hour	12.2	24.5	23	106%	102%
	Annual	7.0	9.2	8.8	105%	103%
	Annual	7.0	9.2	8.00	115%	113%
PM_{10}	24-hour	22.6	83.1	50	166%	156%
CO	1-hour	349	2,373	36,200	7%	8%
	8-hour	362	970.7	15,700	6%	7%
NO_2	1-hour	35.0	127	83.1	153%	158%
	24-hour	29.4	65.5	200	33%	37%
	Annual	14.7	21.3	23.7	90%	97%
Benzo(a)pyrene	24-hour	9.1E-05	1.69E-04	5.0E-05	338%	386%
	Annual	5.1E-05	6.45E-05	1.0E-05	645%	689%
Acetaldehyde	0.5-hour [1]	4.43	4.8	500	<1%	<1%
	24-hour	1.5	1.5	500	<1%	<1%
Acrolein	1-hour [2]	0.15	0.2	4.5	4%	4%
	24-hour	0.06	0.1	0.4	16%	17%
Formaldehyde	24-hour	2.55	2.6	65	4%	4%
Benzene	24-hour	0.46	0.6	2.3	24%	25%
	Annual	0.31	0.3	0.45	72%	72%
1,3-Butadiene	24-hour	0.03	0.03	10	<1%	<1%
	Annual	0.01	0.01	2	<1%	<1%

Similar to the No-Build scenario, for the Build scenario the cumulative maximum predicted concentrations for 24-hour and annual average benzo(a)pyrene exceeded the AAQC. Again, this is mainly attributed to high ambient background concentrations of benzo(a)pyrene at 183% and 513% of the AAQC for 24-hour and annual averaging periods, respectively. However, at most receptors throughout the study area the maximum predicted concentrations of benzo(a)pyrene increase compared to the No-Build scenario. At the highest receptor, 2041 Build benzo(a)pyrene levels reached

386% and 689% of the 24-hour and annual averaging periods, respectively. High background levels are a large part of the cumulative maximum concentrations, but the non-background portion alone is still over the AAQC. **Appendix E.12** shows the contour plots of highest benzo(a)pyrene concentrations.

The percentage change for all contaminants and receptors are shown in **Appendix C.3** and **C.6**, with the predominant increases suggesting an overall worsening in air quality throughout the study area.

The cumulative maximum predicted concentrations for all other contaminants were below their respective thresholds in 2041 except 24-hour $PM_{2.5}$, which exceeded CAAQS at two receptors, annual $PM_{2.5}$, which exceeded both AAQC and CAAQS with 210 receptors showing exceedance of the CAAQS, 24-hour PM_{10}, which exceeded AAQC at 178 receptors, and 1-hour NO_2, which exceeded CAAQS at 1,405 receptors. In 2051, the cumulative maximum predicted concentrations for all other contaminants were below their respective thresholds except 24-hour $PM_{2.5}$, which exceeded CAAQS at four receptors, annual $PM_{2.5}$, which exceeded both AAQC and CAAQS with 281 receptors showing exceedance of the CAAQS, 24-hour PM_{10}, which exceeded AAQC at 347 receptors, and 1-hour NO_2, which exceeded CAAQS at 686 receptors. The concentration isopleths in **Appendix E.3 and E.15** show the impacts for NO_2, with higher levels of NO_2 occurring throughout the study area compared to the maximum concentrations for the No-Build scenario. The concentration isopleths in **Appendix E.6 and E.18** show similar trends in the impacts for 24-hour PM_{10}, and the concentration isopleths in **Appendix E.9 and E.21** show similar trends in the impacts for Annual $PM_{2.5}$.

Tables 4-3 and **4-4** summarize the changes in 1-hour NO_2 concentrations for the ten receptors having the highest maximum cumulative concentration in the 2041 and 2051 project years respectively. The percent change between the maximum No-Build and Build cumulative concentration was calculated for each receptor. The maximum concentrations modelled in the Build scenario are similar to each other (the 10^{th} highest is within 4% of the maximum for 2041). However, there are two different causes for these high concentrations. First, some receptors (like RW110000_024) are high in the No-Build scenario and see only minor (1% for RW110000_024) increases in NO_2 in the Build scenario. The concentrations at these receptors are predominantly affected by existing roadways such as Highway 401. On the other hand, receptors like RW312700_001 are heavily influenced by the project. RW312700_001 sees a 125% increase in NO_2 between the No-Build and Build scenarios in 2041.

Table 4-3: Summary of No-Build vs Build for 1-Hour NO_2 - 2041

Receptor ID	Description	Maximum Cumulative Concentration (µg/m³)			Frequency of Exceedance (%)	
		2041 No Build	2041 Build	Percent Change	2041 No Build	2041 Build
RW110000_024	Residential	129.44	131.33	1%	1.7%	2.4%

Tables **4-5** and **4-6** show the changes in maximum cumulative PM_{10} concentration in the 2041 and 2051 project years respectively. The top receptor, RW224200_001, sees its maximum modelled concentration increase 123%. This pushes it from meeting AAQC to exceeding the standard. **Tables 4-5** and **4-6** also show that 2051 has higher maximum cumulative concentrations than 2041. In 2051, the highest receptor has a concentration approximately 6% greater than it does in 2041.

Table 4-7 and **4-8** summarize maximum cumulative concentration and frequency of exceedance for 2041 and 2051 for Annual $PM_{2.5}$. Relative to other pollutants, $PM_{2.5}$ has smaller relative increases between the No-Build and Build scenarios. Also, as mentioned in **Section 2.8**, PM is generated from two sources: tailpipe emissions and re-entrained road dust. For $PM_{2.5}$ in 2041, tailpipe emissions are approximately 10% of the re-entrained road dust. As stricter vehicle emissions standards emerge, tailpipe emissions of particulate matter decrease. In 2051, though, the decreases in tailpipe emissions are offset by increases in re-entrained road dust due to higher traffic volumes.

Table 4-7: Summary of No-Build vs Build for Annual $PM_{2.5}$ — 2041

Table 4-9 shows the maximum cumulative concentrations and frequency of AAQC threshold exceedance for benzo(a)pyrene under the No-Build and Build scenarios in project year 2041. In both the Build and No-Build scenarios, the frequency of exceedance is 100% for every receptor in **Table 4-9**. As previously mentioned, this is due to the high background concentration relative to the threshold.

Table 4-9: Summary of No-Build vs Build for 24-Hour Benzo(a)pyrene — 2041

Receptor ID	Description	Maximum Cumulative Concentration (µg/m³)			Frequency of Exceedance (%)	
		2041 No Build	2041 Build	Percent Change	2041 No Build	2041 Build
RW110100_001	Residential	1.50E-04	1.93E-04	29%	100%	100%
RW110000_017	Residential	1.69E-04	1.92E-04	14%	100%	100%
RW226000_001	Residential	1.06E-04	1.86E-04	76%	100%	100%
RW110000_024	Residential	1.75E-04	1.86E-04	6%	100%	100%
RW110000_019	Residential	1.42E-04	1.84E-04	29%	100%	100%
RE521600_004	Residential	1.79E-04	1.84E-04	2%	100%	100%
RW312700_001	Residential	1.11E-04	1.83E-04	65%	100%	100%
RW110000_016	Residential	1.60E-04	1.83E-04	14%	100%	100%
RW317500_003	Residential	1.33E-04	1.82E-04	37%	100%	100%
RW317500_001	Residential	1.30E-04	1.82E-04	40%	100%	100%

It must be noted that **Tables 4-3** through **4-9** report maximum cumulative concentrations. Alone, maximum cumulative concentrations only communicate the worst-case averaging period (e.g., 1-hour, 8-hour, 24-hour, or year) for a pollutant. To help interpret how often a high concentration may occur, **Tables 4-3** through **4-9** also include the frequency that a pollutant exceeds its relevant threshold. Combined, these two parameters give an idea of how often high concentrations may occur, but they are limited in describing the full distributional changes (e.g., average, variance) in cumulative concentrations that may occur as the result of a project.

4.3 Frequency Analysis for 1-Hour NO_2 and 24-Hour PM_{10}

The frequency analysis of 1-hour NO_2 for the 2041 Build scenario is presented in **Appendix G.1.2** and shows exceedance at the most impacted receptor, RE110000_005, 2.5% of the time. This is a marginal increase at this receptor

compared to the No-Build frequency of 2.4% and may be attributed to shifts in alignment of ramps and changes in traffic volumes on Highway 401. Although the conditions at the most impacted receptor change only marginally, receptors that are near the project but not near any other highway see larger increases in frequency. In general, there is an increase in the frequency of exceedance of the 1-hour NO_2 CAAQS threshold at all receptors throughout the study area. Frequency of exceedance generally decreases where receptors are located further from major highways.

The frequency analysis of 24-hour PM_{10} for the 2041 Build scenario is presented in **Appendix G.2.2** and it shows exceedance at the most impacted receptor, RE110000_005, 1.5% of the time, an increase over the frequency of 1.0% in the No-Build scenario. The number of receptors showing an exceedance of the AAQC increased compared to the No-Build scenario, but the frequency of exceedance is generally low to zero throughout the study area where receptors are not located in close proximity to major highways.

It is not possible to configure the modelling files within AERMOD to return a count of exceedance of the CAAQS threshold. The frequency analyses are based on exceedance of standard by the maximum predicted concentration, and therefore the frequencies reported are more conservative than would be expected based on the CAAQS.

4.4 Mitigation

Effective mitigation of traffic-related air pollution requires collaborative efforts across multiple sectors at all levels of government, including municipal (e.g. official plans, transportation plans, site plans), provincial (e.g. policy guidelines and support for regional integration and connectivity), and federal (e.g. vehicle emission standards and fuel quality improvements).

The suggested mitigation strategies acknowledge the following: 1) the need to reduce vehicle emissions through improved technologies and alternative fuels; 2) the importance of maintaining reasonable separation between sensitive land uses and transportation sources; and 3) the importance of policies and guidelines, such as those established through municipal official plans, zoning, and transportation plans, that support alternative modes of travel and reduction of travel miles through community and transportation planning.

4.4.1 Setback Distance

As a mitigation to air quality impacts in proximity to future residential areas, municipalities and development proponents could take measures to ensure reasonable setback distances from roadways to reduce the potential impacts of higher concentrations of contaminants and re-entrained road dust that occur closer to the roadways.

In Ontario, municipalities have approval authority and responsibility to ensure that future development proposals are protective of health and safety. Studies have described the potential impacts of traffic-related air pollution and provide general guidelines for setbacks of sensitive land uses such as schools, hospitals, long-term care facilities, and residences from major roads to mitigate exposure to transportation-related air pollution and offer additional mitigation recommendations where appropriate setbacks are not possible (City of Toronto, 2017). These resources emphasize the importance of land-use planning at the city, neighbourhood, and site level to separate sensitive uses from sources of transportation emissions, reduce traffic congestion, minimize entrapment of contaminants at street level, and support active transportation and transit. The application of these principles would be implemented through site-specific planning and design considerations associated with individual development proposals.

4.4.2 Roadside Vegetation

Planting of roadside vegetation within the study area can stabilize the soil adjacent to the road, reducing erosion and subsequent deposition of particulates on the road surface. Studies of the reductive effects of vegetation on air-borne pollutants have especially focused on particulate matter through the mechanisms of deposition, dispersion, and modification (Diener and Mudu, 2021), noting that dense plantings of trees and shrubs can act as windbreaks to reduce wind velocity near the road surface and reduce the dispersion of disturbed road dust (Abhijith et al., 2017). The relative effects of deposition, dispersion, and modification depend on local factors, and the goals of air-pollutant reduction must also be considered in connection with other benefits of vegetative plantings such as watershed protection, biodiversity and wildlife support, climate change resilience, and aesthetic enhancement. Guidance from landscape designers and plant biologists based on consideration of plant morphology, seasonality, and diversity of native plant species can ensure resiliency and year-round effectiveness of high-density, low-porosity plantings that provide benefits of erosion

control and windbreaks. Recommendations for general vegetation enhancement in the Highway 413 corridor are discussed in the Landscape Composition Planning Phase Report (WSP, 2024). Plantings that are native species appropriate to the area are specified.

Although some studies indicate potential reductive effects of green infrastructure for NO_2 and benzo(a)pyrene (Klingberg, et. al., 2017) the research is not as extensive as for particulate matter.

4.4.3 Congestion Mitigation

Strategies to mitigate congestion and improve traffic flow, such as ramp metering, real-time traffic monitoring, and high-occupancy vehicle lanes, are used elsewhere in the Ontario highway network to alleviate congestion. Consideration of similar strategies can be made to assist in optimization of travel throughout Highway 413 Corridor. Measurable indicators of traffic congestion, such as the volume-to-capacity ratio, should be monitored and consideration given to feasible methods to improve level of service where required.

4.4.4 Construction Air Quality Management Plan

The potential air quality impacts due to construction of the Project were estimated based on modelling of a generic representative construction operation scenario and assessing the potential impacts at receptors against the MECP AAQCs and CCME CAAQS threshold concentrations. Predicted concentrations at some receptors were above the thresholds for 1-hour NO_2, annual NO_2, 24-hour TSP, annual TSP, 24-hour PM_{10}, 24-hour benzo(a)pyrene, and annual benzo(a)pyrene. In practice, air quality impacts from construction activities are temporary in nature, and the emissions are highly variable, difficult to predict, and depend on the specific, localized activities that are taking place and the effectiveness of standard mitigation measures. Best practices to reduce impacts of these emissions can include diligent implementation of operating procedures such as application of dust suppressants, reduced travel speeds for heavy vehicles, efficient staging of activities, and minimization of haul distances. To minimize potential air quality impacts during construction, it is recommended that the construction tendering process should include requirements for implementation of an air quality management plan that would establish best management practices specific to the details of construction required for the Project. The air quality management plan should include provision for meteorological monitoring (e.g. wind direction and speed), visual monitoring (e.g. opacity of dust plumes), a stakeholder communication and complaint

process, and, where applicable and feasible, any additional mitigation measures as outlined in Best Practices for the Reduction of Air Emissions from Construction and Demolition Activities (Cheminfo, 2005) and the MECP Technical Bulletin: Management Approaches for Industrial Fugitive Dust Sources (MECP, 2017b).

4.4.5 Technological Innovation and Regulatory Policy

Benzo(a)pyrene emissions from motor vehicles have been characterized as being directly proportional to the number and types of motor vehicles powered by combustion of fuels derived from petroleum (California Air Resources Board, 1994). The introduction of catalytic converters in the 1970s reduced benzo(a)pyrene emissions from mobile sources, and the more recent introduction and development of alternative fuels including electric vehicle technology is expected to further reduce benzo(a)pyrene emissions. Technologies and policies that reduce the number of kilometres travelled by vehicles powered by petroleum derived fuels will reduce emissions of benzo(a)pyrene and NO_2 and mitigate the impacts of these contaminants.

Continued support and investment at all levels of government in policies, technological innovations, and phased-in regulations for on-road vehicle and engine emissions should encourage continued evolution of the vehicle fleet in Ontario toward alternative fuels and electrification which is expected to reduce NO_2 and other tailpipe emissions.

Continued support and investment in policies and innovations that promote the development of complete communities and transit-oriented communities, as well the local and regional public transportation infrastructure required to support them, could encourage sustainable local economies and equitable opportunities, and potentially improve level of service across the existing transportation network. Improved level of service would potentially reduce traffic congestion and delay and therefore reduce associated local air quality impacts. Regional policies that support public transportation contribute to an overall strategy of emissions reduction by reducing the number of kilometres travelled by vehicles powered by petroleum derived fuels. Municipal policies supporting active transportation, public transportation, and transit-oriented communities would be incorporated into municipal official plans and supporting transportation master plans.

5. Monitoring and Commitments for the Undertaking

5.1 Environmental Effects Monitoring

No additional air quality monitoring has been specified for the Project.

Roadside air monitoring occurs in Ontario with three dedicated roadside monitoring stations and ten additional stations from the ambient air quality monitoring network designated as supplemental roadside stations. The current roadside network includes stations representing high-traffic conditions (Highway 401 in Toronto West) and lower-traffic conditions (North Bay and Toronto Island) (MECP, 2025b). The current ambient air quality monitoring stations represent varying proximities to traffic-related air pollution, and the trends observed through this data could be reflective of the conditions in the Highway 413 corridor. Under guidance by the Ministry of the Environment, Conservation and Parks, additional stations could be considered for inclusion in future to broaden the understanding of trends in traffic-related air pollution in urbanized settings.

5.2 Commitments

The planning and design process for the Highway 413 transportation corridor has involved extensive data collection and analysis since 2007. This phase has resulted in the development of a preliminary design of the corridor, along with associated mitigation measures. However, further data collection and analysis, as well as public, agency and Indigenous community consultation and engagement are deemed necessary to finalize specific environmental design and mitigation measures.

MTO has made a number of commitments that will need to be followed through during subsequent design, construction, operation, maintenance phases of the Highway 413 corridor based on the impact assessment of the Preliminary Design and in response to issues raised and comments received during the Preliminary Design. A summary of these commitments specific to air quality is provided in **Table 5-1** below. If any permitting/registration is required, it will be completed during Detail Design.

Table 5-1: Summary of Preliminary Design Environmental Mitigation and Commitments

ID	Summary of Mitigation and Commitments
AQ.01	Ensure municipal awareness of the Highway 413 Project such that reasonable setback distances from roadways may be considered during future residential development within the study area to mitigate the potential impacts of higher concentrations of contaminants and re-entrained road dust that occur closer to the roadways.
AQ.02	Planting of vegetation within the study area to provide erosion control adjacent to the road and act as windbreaks to decrease wind-driven dispersion of resuspended particulates.
AQ.03	Apply strategies to mitigate congestion and improve traffic flow. This can include strategies such as ramp metering, real-time traffic monitoring, and high-occupancy vehicle lanes.
AQ.04	Continue support and investment for policies, technological innovations, infrastructure, and phased-in regulations for on-road vehicle and engine emissions to encourage continued evolution of the vehicle fleet in Ontario toward alternative fuels and electrification, which is expected to reduce NO_2 and other tailpipe emissions.
AQ.05	Continue support and investment in policies and innovations that promote the development of complete and transit-oriented communities, as well as the local and regional public transportation infrastructure required to support them, to encourage sustainable local economies, equitable opportunities, and potentially improve level of service across the existing transportation network.

6. Summary and Conclusions

The project is expected to impact local air contaminant levels at receptors throughout the study area, with the maximum predicted cumulative concentrations increasing with the project at most receptors, especially in the middle sections of the Highway 413 corridor which are currently predominantly rural.

Although model-predicted concentrations are expected to increase, the maximum cumulative concentrations for most contaminants and averaging periods remain below their respective current thresholds. Contaminants and averaging periods with modelled cumulative concentrations exceeding AAQC or CAAQS thresholds include 24-hour and annual benzo(a)pyrene, 1-hour NO_2 (CAAQS), 24-hour and annual $PM_{2.5}$, and 24-hour PM_{10}. Some of these exceedances can be attributed to high background concentrations as 24-hour and annual benzo(a)pyrene have background concentrations over 100% of the threshold value and annual $PM_{2.5}$ has a background level 88% of the threshold.

Exceedances of the 1-hour CAAQS threshold for NO_2 at receptors in the study area for the No-Build scenario are generally at the western and eastern ends of the Highway 413 corridor close to the existing Highways 400 and 401. Under the Build scenario, exceedances increase in frequency and extend throughout the study area.

24-hour PM_{10} threshold exceedances follow a similar trend to NO_2. Exceedances expand from localized areas in proximity to Highways 400 and 401 under the No-Build scenario to the general extent of the study area under the Build scenario.

There are a few strategies that could be pursued to mitigate the effects of air pollution resulting from the project. Future residential areas could be setback further from roadways to avoid high concentration areas. Roadside vegetation could be planted to stabilize soil and reduce travel distances of road dust that becomes airborne. To minimize potential air quality impacts during construction, an air quality management plan should be implemented that establishes best management practices specific to the details of construction required for the Project. Supporting and investing in policies for engine emissions and alternative fuels would reduce vehicle emissions through improved control technologies and a shift toward lower emissions fuels and electrification. Supporting and investing in polices for transit and active transportation would reduce traffic congestion and further reduce vehicle emissions.
